PREPARATION OF THIS DOCUMENT

Reorganization of the artisanal fishery sector in the Mediterranean is one of the recurring issues in the many debates on the future status of its fisheries. At the same time, it is believed that more knowledge on this sector is indispensable. Therefore, only an appropriate assessment of these fisheries and the resources they exploit, including the other economic components implicated in the same area, will enable modern and effective management.

The project Cooperation Networks to Facilitate Coordination to Support Fisheries Management in the Western and Central Mediterranean (COPEMED) took up the challenge to assess the artisanal fisheries in its eight member countries through a subregional project activity, thus for the first time acting at the regional level on an issue which is normally only dealt with at national level.

The inventory implemented by COPEMED produced a comprehensive listing of all the artisanal communities performing artisanal fisheries in the region including their localization, description, practices, pictures and some other ancillary information.

The whole study, summarized in this document, consisted of the planning and realization of: (a) the methodological design; (b) the data collection (field work); (c) the database Artisanal Fishery in the Mediterranean (ArtFiMed); (d) the case studies; (e) the processing and analysis and (f) the CD-ROM output, including appropriate documentation and a power-point presentation.

It is also worth mentioning that this exercise, based on 13 582 sites visited (interviewed), has produced 11 papers, involved 16 regional and national scientists, and has also gathered a selected bibliography of about 200 documents concerning artisanal fishery in the Mediterranean region.

Coppola, S.R.

Inventory of artisanal fishery communities in the Western and Central Mediterranean.

Rome, FAO. 2006. 82p.

ABSTRACT

For years, the impoverishment of artisanal fishery in Mediterranean countries has been frequently reported at all levels when the urgency for intervention was systematically highlighted. In addition, it has also been reiterated that, at present, there is not enough knowledge either of the primary and secondary magnitudes of artisanal fishery or of the normative and managerial tools that cover the entire spectrum of competence. Information on artisanal fishery, in the wide sense, is fundamental for planning and management purposes. It is, therefore, extremely important to document all the elements which influence and interact directly or indirectly with artisanal fisheries, (e.g. synergies, conflicts or friction, possible interaction and connection, etc.). During the project Cooperation Networks to facilitate Coordination to Support Fisheries Management in the Western and Central Mediterranean (COPEMED), the first-ever inventory of regional artisanal fishery communities in the Central and Western Mediterranean was implemented. This was possible through direct assistance to some of the member countries to develop and improve their capacity to collect and analyse information on artisanal fisheries. The inventory resulted in a comprehensive list of all the fishing communities performing artisanal fisheries in the region, including their localization, description, use, pictures and other ancillary information. This exercise, based on 13 582 sites visited (interviewed), produced 11 papers, involved 16 scientists (regional and national), and also collected a selected bibliography of about 200 documents. Most of the results are presented in this paper.

PREFACE

The review of artisanal fisheries in the Mediterranean, or rather paying artisanal fisheries different attention to that given in the past, has already been initiated through recurring debates on the future status of the fisheries in the Mediterranean. Artisanal fisheries is the weakest element when negotiating management issues on a large scale, and its interaction with the many other activities in the same (shared) area calls for special attention. It is believed that more knowledge, and specifically results from case studies based on actual situations, can help to visualize the changes needed to direct artisanal fisheries toward a more modern management, respected by and respectful of the environment, fishery, etc.

This study is the output of a team that has worked part time, in many cases voluntarily, to achieve some results, which they consider not the point of arrival but the start of deeper analyses and more sector studies. This work has been totally developed, in all its components, within the Cooperation Networks to Facilitate Coordination to Support Fisheries Management in the Western and Central Mediterranean (COPEMED) FAO project. The list of contributors and consultants that have participated is given in Appendix 1.

Since the COPEMED project and the countries had assigned high priority to this study and because this was the first time such an inventory had been undertaken at a regional level, the first release was elaborated and produced (despite some missing data because of coverage problems in some countries) soon after the main field work had been completed. Missing data were mainly due to uncertainties that had arisen, in some cases during the data collection phase and, in others, to changes of priorities and objectives. However, once the report had been distributed, it became evident that there was a need for information on the situation of the artisanal fishery in the region as a whole and that the missing data had diminished the results achieved so far.

The COPEMED project therefore launched a second round to complete and consolidate the information, where needed. As a result, all countries contributed and excellent coverage, both spatial and typological, was achieved, with the exception of Italy where information was collected only in Sicily and partially for the Campania region. In this second edition the whole dataset generated by the application is considered.

Additional refining of the national names in the species and métier/gear databases was undertaken and more precise port and landing-place geographical references were added, and while these cannot be considered exhaustive they remain a good base for future applications.

It might also be reported that during the same period the project launched two cases studies as immediate follow up.

INTRODUCTION

The need to improve knowledge about the artisanal sector has been underlined on many occasions. This sector involves many countries, encompasses many fishing gears and methods, its resources, shared among various parties, move from one region to another, and the size of the fish catch varies from country to country, as does its economical value. Only an appropriate assessment of these fisheries and the resources they exploit, including the other economic components in the same area, will enable modern and effective management. Through this initiative, the COPEMED project also offered the possibility of carrying out a programme of work to study this sector in depth in its area of competence (Algeria, France, Italy, Libyan Arab Jamahiriya, Malta, Morocco, Spain and Tunisia).

Information on the artisanal fishery sector, in the wide sense, is fundamental for planning and management purposes provided that it covers most of the interacting elements. It is, therefore, extremely important to document all the elements in related sectors which intervene and interact directly or indirectly with artisanal fisheries, and describe synergies, conflicts or frictions and possible interactions and associations.

Taking into account the different levels of knowledge and information of the sector in the various countries, it is desirable to foresee such a programme diluted over the long term, and to execute it in steps. A workshop held in Malta in March 1998 was the first step, the starting point of the entire programme.

This programme was undertaken using national experts as much as possible with the aim of increasing national competence under the coordination of, and in consultation with, an international team covering distinct subjects (statistics, biology, economics, management), which is responsible for providing the main direction and guidelines. The team was provided by the FAO-COPEMED project as necessary.

The methods and results have been put at the disposal of all participating country administrations as well as of the various institutes and laboratories in the region. The status of this work has been submitted regularly to the Scientific Advisory Committee (SAC) of the General Fisheries Commission for the Mediterranean (GFCM).

1. BACKGROUND

At one of the annual Steering Committee meetings of COPEMED the question of the lack of systematic information on artisanal fisheries at the regional level was put forward and given considerable attention. The Steering Committee supported the plan to reinforce the data collection system of this sector, due to its great importance in the region, and promoted a seminar on this topic.

After an assessment of the poor level of knowledge of the artisanal fishery sector in the region, and of its integration within the countries, there was a unanimous consensus to extend the mandate of the seminar to a medium-term programme of work. One of the main issues of such a programme was to assist in finding solutions and alternatives to establish a robust data collection system, useful for sectoral studies in the region.

Within this framework, the Workshop in Malta was used to start the operation aimed at reinforcing national systems and their capabilities in artisanal fisheries, using the most appropriate methods and expertise to secure regional exchange of data, techniques, results and software. A detailed programme of work was set up by the co-coordinating group within the COPEMED project.

2. THE ORIGINAL PROGRAMME

2.1 The objective

The objective of the original programme was to review the artisanal fisheries statistics produced by all countries in the COPEMED area. Because of the nature of the mandate, the programme was mainly based on statistical monitoring, data collection and dissemination. It was planned, firstly, to undertake an assessment at the national level, followed by a complete study that would consist of (1) an inventory of existing information and data; (2) defining the characteristics of artisanal fisheries at the national level; and (3) defining standards in order to harmonize outputs from national statistical systems to allow regional aggregation, at least in the western central Mediterranean by:

- ❖ identifying the institutions in charge of statistical surveys and dealing with artisanal fisheries in the Mediterranean;
- ❖ contacting the national persons responsible, introducing the objectives of this programme to them and exploring the possibility and feasibility of the COPEMED project helping to improve the methodology, the approach, the manuals, forms and questionnaires that they used, in order to harmonize the data collection and reporting instruments (codification system, reporting statistics, frequency of updating, etc.);
- ❖ preparing a questionnaire, for distribution among the national experts responsible for the data collection, to obtain general information on the status of data collection (qualitative and quantitative) on artisanal fisheries in their respective countries;
- ❖ as an end product, preparing a series of national reports on the existing statistical systems covering the different aspects of data collection, processing and presentation as a whole. Also, the analytical part of the statistical systems, including analysis of the results, would have been stressed in order to start evaluating the level of accuracy and reliability of the results produced.

The main issue of this exercise, after a regional or subregional review of all the ongoing systems, was to identify the system which appeared to be the most appropriate model as the starting point for regional discussion. The role of this system as a "starting point" and not as "the model system itself" must be stressed. It is well known that in this field it is not advisable to replicate practices or duplicate and adapt a system developed for other scenarios.

The programme of work also envisaged, once the assessment had been completed and duly analysed, to undertake further activities, such as:

- (a) Involving sectoral experts to design and implement multidisciplinary pilot studies.
- (b) At the end of the programme, being able to assist in formulating strategies for the rehabilitation of the artisanal fishery sector, followed by decision support systems constructed on real data, using utilities and models not built only on empirical considerations or theory. Such strategies should also take into consideration basing their evaluation and studies on management tools developed or conceived within a regional context.
- (c) The ultimate objective of this task was to assist, whenever requested, in the establishment of a data collection system for artisanal fisheries in all the member countries.

In the view of the project team, the first important task was the organization of the workshop in Malta where the whole programme of work, the objectives and the expected results would be presented, discussed, and the first phase implemented immediately. At the same time, the project working group (WG) started to collect and scrutinize all the bibliographies dealing with artisanal fisheries published so far including those not published through official channels.

Objectives (a) and (b) had to be undertaken in the shortest time possible whereas objective (c) had to be planned carefully and implemented gradually, because it was largely dependent on the previous steps.

It was stressed that, in this exercise, all national participants would act as national experts rather than as national representatives, and would work as a WG, whose composition might change according to the topics that, along the way, were taken into consideration. Expertise in such subjects as economics, management, environment, geographic information system (GIS), etc., were also to be incorporated in the WG.

All the national participants would be requested to critically present at the workshop the status of the data collection system in their own area of interest and comment their interaction within a regional context.

2.2 The objective situation reported

At the workshop, national experts presented their reports and the statistics were submitted according to a given format. The whole set of reports was published as an addendum to the meeting summary.

Other experiences undertaken outside the Mediterranean area or specific case studies conducted by researchers outside this scheme were also presented. In particular, the statistical survey system tested for the artisanal fisheries in Guinea, implemented by the Office de la Recherche Scientifique et Technique Outre-Mer (ORSTOM), was presented.

This exercise was developed to see whether experiences outside the Mediterranean could be used to optimise our work. It focused particularly on the methodology developed and the results obtained.

A certain number of communications concerning studies undertaken in this field were also presented. These, geographically localized, helped to assess the situation and status of this research in the Mediterranean Sea.

Among others things, it is important to mention the following:

- ❖ the artisanal fisheries in Tuscany (Italy)
- ❖ the artisanal fisheries in Andalusia
- ❖ characterization of the artisanal fisheries in a zone of Alicante (impact analysis on the use of artificial reefs)
- ❖ the small-scale fisheries in the central Adriatic (Marche)
- ❖ the dolphin fish fishery in Sicily
- ❖ application du Système d'information géographique (SIG) aux pêcheries artisanales dans le nord de la mer d'Alboran (Méditerranée occidentale).

For the needs of the COPEMED programme the métiers (vessel/gear) to be considered as the starting point for artisanal fishery were finally agreed on. The main difficulty encountered was that this sector deals with a heterogeneous population in space, over time, the gear and use of the same, etc.

To start with, artisanal fishery includes all the métiers that are not typically or strongly industrial, such as the following, which are excluded.

- ❖ trawlnets
- ❖ large seines for small pelagics (other than those using lampara)
- ❖ gear targeting great migratory species (purse seines, longlines, drift nets, stationary uncovered pound nets—madragues, tuna rods, trolling lines)
- ❖ hydraulic dredges for shellfish
- ❖ “large” longliners (a Moroccan specificity; the term large should be clarified).

Based on the papers presented and the discussion generated, it was stressed that further reflection was needed to see how it would be possible to define artisanal fishery in the region, covering all, or most, of the characteristics and peculiarities of the single national and local fishery practices. In fact, in most cases, the different terms used to define an artisanal fishery activity: artisanal fisheries, petit pêche, piccola pesca, pêche cotiere, pesca costiera, etc., were not only a matter of semantics or translation. Different countries, in the same region, use different criteria to classify artisanal fishery considering different notions simultaneously, from the economical and socio-economical environment, to the type and size of the boat and the engine, the target species, fishing habits and tradition. As a matter of fact, métiers included in one country may be excluded in another.

2.3 Effort to define the artisanal fishery in the COPEMED area

The most important step, after the presentation and discussion of the national reports, was to encompass the different components of artisanal fisheries in the various countries of the region into a practical definition for the needs of COPEMED.

Artisanal fishery includes very diverse fishing techniques and practices, used by very varied boats and work platforms. The objective here is not to propose a definition, but to make the readers

aware of this diversity. The list below, which is not intended to be complete, includes a certain number of elements that describe artisanal fishery.

Special mention should be made of the COPEMED countries belonging to the European Community (EC), since there are great expectations that the results of the work programmed would help to give more visibility to the peculiarity of the Mediterranean artisanal fisheries. This important sector is generally minimized and management and legislative decisions are influenced accordingly.

From the national definitions of their artisanal fishery, it seems that three criteria are always present in the definition of artisanal fishery operations:

- ❖ boat length;
- ❖ gross tonnage and fishing gear;
- ❖ target species.

An effort was made to identify the most important reported characteristics that demonstrated artisanal fishery diversity at the technical and economic level.

❖ at technical level:

- ✓ small tonnage (\leq 10 TJB)
- ✓ low power < 100 HP
- ✓ with or without outboard engine
- ✓ reduced autonomy < 24 hours
- ✓ very often, locally produced engines
- ✓ minimum or non-existent safety equipment
- ✓ use of many fishing gears, depending on:
 - the presence of species, in space and time
 - the nature of the sea bed
 - the existence of specific regulations
 - an important knowledge of target species and of their behaviour
 - noble species fishery

❖ at socio-economic level

- ✓ boat owners (or their family)
- ✓ practice of another professional activity
- ✓ small crew (1 to 5 people)
- ✓ high employment in connection with investment
- ✓ direct sale to fish shops or restaurants
- ✓ individual catches of low tonnage but of high value
- ✓ small hierarchy in the work at sea.

The large lampara-o fishery, mainly targeting a group of small pelagics, should not normally be defined as artisanal fishery. In Italy, where this activity is largely observed, it is performed by large vessels, but also by a great number of small vessels sometimes with only one fisherman. In this latter case it is definitely an artisanal practice. Since it was not possible to separate the lampara fishing performed with large boats (sometimes using accessory boats) from that using typically artisanal boats, it was agreed to classify all lampara fishing in the Mediterranean as artisanal fishery, regardless of the size and typology of the fishing unit. In the case of Spain, it was reported that they would have a problem in classifying these vessels as artisanal, since some

of them are only used as lampara boats for about six months of the year while for the rest of the time they are fishing in the north of the country using industrial gear.

2.4 The agreed change of objectives

At this point it was evident that most of the statistics reported (in the wide sense) could not be considered of significant importance at the regional level, because they lacked one of the fundamental rules of regional aggregation: standardization of the items included. In conclusion, there was no ground to continue with the original plan, and to do so would only have been of academic interest. The group of experts agreed on the proposal to re-assess the status of artisanal fisheries in the Mediterranean, starting with the definition of artisanal fisheries. It was stressed that its intention was not to impose standards, but it can be stated that whatever is reported and estimated under this study refers to a defined unit. For this reason, the activity concerning artisanal fishery could not be reduced to a number of meetings and working groups, but had to concentrate on the action being undertaken with the countries according to their level of interest.

Such a programme of work should assist institutions and fishermen's associations to find solutions to (or even to understand better) problems concerning the practice and management of artisanal fisheries. It is expected that the accomplishment of such a programme will enable us to obtain results in the short (few months), medium and long terms (three years).

In the short term, a regional information system for artisanal fisheries in the western central Mediterranean would be set in motion (documentation, "métiers", identification, etc.).

In the medium term, this information system would enable organizing the statistics collection within a framework of purposive surveys or an already initiated statistical system. Good catch and effort data, population dynamics parameters and socio-economic data will allow the mechanisms interacting in this sector to be understood, and to identify test zones to start in-depth comparative studies.

Finally, the possibility of using simulation tools to implement strategies for the rehabilitation of the artisanal fishery sector should also be envisaged. Among others things, the use of geographic information systems was considered.

2.5 Workshop's conclusions and recommendations

The conclusion of the workshop in Malta resulted in a change of the objectives of our initial plan. It was decided to study the situation more deeply by visiting all the countries and becoming acquainted with their artisanal fishery practices. This field of activity should also emphasize the relationship and the interaction of the artisanal communities with real life which constitutes a unique "ensemble" whose components cannot or should not be analyzed separately because they are significantly interdependent. It is believed that when management decisions need to be taken for artisanal fisheries, due attention should also be given to all the other activities (industrial, manual, social, economic, ethical, etc.) in the same area. A reconnaissance survey should also be launched to produce as complete as possible an inventory of the many communities performing artisanal fisheries in the region. This study, that purposely is not intended to be a classic census, should produce a comprehensive document listing all the artisanal communities in the region including their localization, a description, the use, possibly a photo and other ancillary information. It is strongly believed that only after such an exercise would it be possible to revitalize the idea of formulating data collection systems for artisanal fishery based on regional standards to enable a comparison.

For the exchange of information between researchers, administrations and the COPEMED scientists an Internet workgroup has been set up, managed by the team leader and open only to the activity group members.

As already stated, it was purposely decided to launch an inventory and not a census for two main reasons: (a) COPEMED does not have a mandate to directly conduct national censuses, and (b) the organization of a census at the national level is an issue that needs to be discussed fully with the many institutions in the country dealing with national census. This would have definitely jeopardized the materialization of the inventory.

It was decided to propose to the countries in the COPEMED area that they participate in a joint effort within COPEMED technical assistance to develop or improve their capacity to collect and analyze information on artisanal fishery and favour collaboration between countries to make this idea feasible.

It was also envisaged to utilize, at a later stage, complementary expertise on artisanal fishery management to assist the project and the countries that would have to formulate project plans to adapt results of pilot studies to their own situations in order to:

- ❖ assist in setting up management tools for artisanal fishery in the western central Mediterranean; and
- ❖ develop case studies in the region with the peculiarity that their results, methodologies, and the basic information be useful and adapted to other zones and situations.

3. THE NEW APPROACH

3.1 The programme of work

The outcome of the workshop in Malta was indeed very useful to re-arrange the approach to be followed and, at the same time, to reconcile the activities. The aim of this new task was to conduct a preliminary inventory survey (reconnaissance survey) of all the artisanal fishery communities in the Mediterranean area.

This work, carried out simultaneously in all countries covered by the project, enabled us to design an appropriate multipurpose survey in a second phase. This was because the main objective of the activities remained unchanged, i.e., to "launch some studies aiming at defining management strategies for artisanal fisheries to benefit the fishermen's communities and the administrations, and not just be the statistical component".

It was clear that the proposed programme was, in a way, ambitious, but it was stressed that if instead of an activity (one occasion only), a properly formulated programme, with stepwise tasks, was set up it would have a better possibility of being completed or continued in case constraints, delays or different levels of participation occurred. It was also believed that if this programme was mainly directed to the countries, which would finally receive the tool, a higher probability of national follow-up could be expected.

Finally, it was believed and agreed that this exercise would be followed by sectoral surveys (case studies) carried out with the assistance of domain experts to make the results "fruitful".

A new work plan was formulated based on successive steps as follows:

- (a) *Identification and definition of artisanal fisheries*
Undertake a complete review of all the available documentation on artisanal fishery in the Mediterranean.
- (b) *Location of artisanal fishery communities and their activity in space and time*
Define, make an inventory of and localize all the artisanal fishery communities in the region according to a given definition, and memorize the data according to a structure to be used for many other tasks.
- (c) *Assessment of the main non-fishery issues interacting with artisanal fisheries by type, zones, typologies, etc.*
Assessment and description of activities and situations that directly or indirectly interacted with artisanal fishery (holiday localities and infrastructures, marine parks, reserves, platforms, etc.).
- (d) *Inventory of the main fishery components associated with artisanal fisheries*
Assessment of the main fishery components interacting with artisanal fisheries (fleet composition, mariculture, catch, effort, fishermen, etc. – collecting information only, not through exhaustive surveys).
- (e) *Definition and classification into regional typologies (to enable regional comparison and analysis)*
Many of the characteristics included in the inventory needed to be normalized to certain standards. This was especially true for fishing seasons (time), target species and associated species, fishing zone, etc., where information may not be immediately usable, or classifiable. (e.g., the seasonal pattern of a certain artisanal métier performed in many cases from January-June, compared to another reported to be performed from February-June, or another from February-May, and so on). Standardization and subsequent normalization to a common denominator, in order to create classifiable typologies and help implement case studies as sample surveys of "homogenous" sub-populations.
- (f) *Determination and selection of pilot studies*
Formulate and implement in well-delimited areas regionally-oriented pilot studies so that the results were applicable, or could contribute, to other scenarios.
A well-delimited zone would be identified starting from the output of the inventory which should give a global view of the situation regarding artisanal fisheries in the region.
- (g) *Definition of a research programme for the execution of detailed pilot studies in well-delimited zones, the results of which could serve as a relevant model for other zones*
Analysis of detailed information together with other information coming from different sources and disciplines. More than one scenario was taken into consideration for study. Among others, the long-standing problem of conflicts between artisanal and industrial fisheries in certain areas was taken into account. Legislation regulating artisanal fisheries and other aspects dealing with rules, regulations and rights were also addressed. The interaction with other realities and infrastructures sharing the same ground or marine zones, such as agriculture, mariculture, marine parks as well as tourism was also considered in the case studies. This called for an immediate follow up of case studies dealing with the socio-economic sector, biological (stocks) surveys, cost benefit surveys and yield analyses.
Selection of case studies for implementation and, whenever possible, for financing by COPEMED was based on the proposals received and the results obtained during the inventory.

- (h) *Setting up and execution of pilot studies intended to define fisheries management strategies of this sector for the benefit of those parties involved in the fishing sector and in the administration*

For the purpose of studying and proposing management options in the field of artisanal fisheries for the benefit of the fishermen's communities as well as for the administrations, it was also necessary to collect accessory information that might or might not influence the activity. Results of the studies, in order to be re-applicable, re-considered or even used to demonstrate scenarios, were presented as models or through an interactive model that also had to be developed.

These management options can be "visualized" and evaluated through various media and with the assistance of some well-defined tools. Among other things, this programme intended associating the results with such tools as:

- ✓ Analyses through GIS.
- ✓ Long- and short-term analyses of the variations in the artisanal fisheries.
- ✓ Use of bio-economical models, etc.

- (i) *Presentation of the results and critical analyses of the results*

The output of the inventory phase was prepared as a series of papers, tables, maps and typologies of artisanal fishery at the regional level. The results have been incorporated into the Project Home Page dealing with GIS (initiative under development), with the Encyclopedia of the Species of the Mediterranean, and the Fishery Atlas of FAO. The results of the case studies have been published and sent to the appropriate people and institutions for further consideration.

3.2 The inventory programme

The purpose of the preliminary phase of this work was to establish a detailed inventory of the artisanal fisheries and their geographical location. The project subsequently prepared a series of tables, maps and typologies aimed at extending the presentation of the artisanal fishery characteristics at the regional level.

The preliminary objective of this work was the elaboration of a comprehensive document containing an inventory of all artisanal fisheries present in the Western and Central Mediterranean, GIS maps showing their distribution, and a description of the main fisheries with some preliminary analysis.

These results have been integrated into the project's internet page, in the GIS in progress, and also in the Mediterranean and the FAO fisheries atlases.

A comparative analysis of practices, terminology and interpretation of artisanal fisheries in each country enabled a standardized method to define the artisanal fisheries in the region to be established.

Artisanal fishery is defined as the combination of the

<u>Port</u>	<u>Gear (métier)</u>	<u>Target species</u>	<u>Fishing zone</u>	<u>Fishing season</u>
--------------------	-----------------------------	------------------------------	----------------------------	------------------------------

All métiers are included in artisanal fisheries except for those practiced with the following gear:

- ❖ trawlnets
- ❖ large seines for small pelagics (other than those using lampara)
- ❖ gear targeting large pelagics (purse seines, longlines, drift nets, stationary uncovered pound nets–madragues, tuna rods, trolling lines)
- ❖ hydraulic mollusc dredges
- ❖ large longliners.

A regional information system, “ArtFiMed”, covering artisanal fishery in the western central Mediterranean with a GIS application tool has been developed and is being used by all the parties concerned.

The methods, tools, and results have been made available to all participating country administrations as well as to all the various institutes and laboratories in the region and fishermen’s associations. The achievements are submitted to the Scientific Advisory Committee (SAC) of the General Fishery Commission for the Mediterranean (GFCM).

3.3 Standardization of the data items

The second most important objective of the Malta workshop was to find a common denominator to define artisanal fishery and, soon after, initiate an inventory of artisanal fishery communities classified according to a prefixed description. The main reason for the non-homogeneous data found during the discussion was that the specifications and data structure of the reports to be submitted were insufficiently detailed or were not followed correctly. It was decided to pursue the following standards to collect and present data.

Participating countries were invited to submit the data in the shortest possible time.

3.3.1 Fishing gear

The fishing gear definitions and classification were based on the FAO classification (Table 1). Experts from each country reported on the gear used for artisanal fishery, classifying them according to FAO standards. Many engines in the artisanal family do not fall under any international classification. In the past, this group was classified as “Other”. The national experts therefore first identified the class of origin of the gear, classified it accordingly, and then described the gear and sub-classified it within the country list. At the end of this exercise, a regional compendium was produced giving definition, photos and a homogenous classification of all the artisanal fishing gear, by country and with a regional coherence.

3.3.2 Target species

Artisanal fishery is basically a “species-driven” activity and the gears used are very selective. The target species are those species primarily fished by the fishermen with a certain effort. In many

cases fishermen report targeting more than one “target” species simultaneously. However, it was decided to keep the number of target species to a maximum of three in order of importance.

Associated species, secondary species, etc., in this work were all considered as synonyms to classify non-target species captured during the fishermen’s attempts to catch the target species.

3.3.3 Species name

The standard nomenclature was that of the FAO. No other classification was allowed. The national experts were requested to collect this information, and add to the FAO denominations the national name used for that species. This improved the internal data dictionary, and contributed to the completion of the Encyclopedia of the species in the Mediterranean and the FAO nomenclatorial species database.

3.3.4 Fishing zone

Reporting and classification of the fishing zones reflected the database solution for storing of data. It was firstly decided to use a three-key code to indicate the geographical name of the zone (port, gulf, bank, lagoon), the geographic reference of the zone expressed in geographical coordinates, distance from a known point, or other clear identifier. The description of the fishing zone included the nature of the sea bottom and the depth. This initial exercise was useful to design and classify the zone. In a second stage, a solution was found by introducing a generalized grid map with codified grids for the entire region. (see the spatial structure, para 3.6).

3.3.5 Fishing port

Name of the port and the geographic coordinates, if not already known, had to be calculated through GPS (global positioning system) or other instruments. This included all ports and landing places from where artisanal fishing units operate.

3.3.6 Fishing seasons

The fishing season was considered as the period during which a given métier was practiced, in a certain fishing zone targeting a given species. It was expressed in months according to the table below or in a 12-digit array containing zero (no activity) or 1 (activity) values in sequence.

J	F	M	A	M	J	J	A	S	O	N	D
			^	^	^	^	^				
0	0	0	1	1	1	1	1	0	0	0	0

3.4 Data structure

In order to standardize and facilitate systematic reporting a hierarchical system was established to enable field staff to start the work immediately without waiting for a complex database system to be developed. This approach, though rather tedious, also helped us to develop the database in all its parts, and keep open any further automatic transfer into any database for future applications. As a parallel task, a fully relational database “ArtFiMed” was developed and made available to all participants. It incorporated all the knowledge acquired during the field work and retained its compatibility with other COPEMED national statistical databases.

The whole initial structure was built around Excel and Word files and transferred afterwards into a database with GIS interfaces to ArcView®. Table 3.5 summarizes the fields that were collected during the inventory phase.

This data model refers to the first step envisaged in the work programme concerning the in-depth study of artisanal fisheries in the western central Mediterranean. As agreed, data collected at this level mainly concerned inventory data, and were more qualitative than quantitative.

Its main objective was to gather, with the minimum of resources, and in a relatively short time, all the main characteristics to enable us to obtain an exhaustive inventory of fishing communities performing artisanal fishery, as defined at the meeting held in Malta.

3.5 Coverage

The spatial coverage of this exercise was the total population under consideration. In other words, all the artisanal fishery communities were reported, even where only little ancillary data were known. As far as the data coverage was concerned, four hierarchical levels were introduced, and the following items collected:

- ❖ Country level
- ❖ Port level
- ❖ Community level (elementary artisanal fishery)
- ❖ Item level (gear used, species, fishing zones)

Table 3.5a – Ports, landing places or any other localities where an activity defined as «artisanal fishery» was present

- | |
|--|
| <ul style="list-style-type: none">❖ Name of the port/locality❖ Region or province (administrative) where located❖ Geographical localization of the port in latitude, longitude units.❖ Very brief description identifying the port or locality (few words to explain whether it was a port or a landing place, a seasonal landing place or other).❖ Expected number of artisanal fishing units present in the port (known or subjective estimates)❖ Expected number of artisanal fishermen present in the port (known or subjective estimates).❖ Note. Any ancillary information useful to the work<ul style="list-style-type: none">with:<ul style="list-style-type: none">❖ Description of the ports (about half page) describing the port, its position, the activity, the importance, the coexistence of other activities related to artisanal fishery, etc. Also the presence in the area or in the vicinity of tourist areas, marine or national parks, etc., in a separate fileand:<ul style="list-style-type: none">❖ A photograph of the port or locality, emphasizing the artisanal component |
|--|

Table 3.5b – Items collected for each port, landing place or any other locality

- ❖ Gear used (FAO name in English, French or Spanish)
- ❖ National/local name of the gear
- ❖ Target species (scientific name, or FAO name in English, French or Spanish)
- ❖ National/local name of the target species
- ❖ Associated species (scientific names, or FAO name in English, French or Spanish).
- ❖ Fishing zone by name or a range from the port, or any other indication as appropriate
- ❖ Average depth (known parameter or estimates)
- ❖ Months of activity in the year.
- ❖ Expected number of artisanal fishing units using that gear in that period (known or estimates)
- ❖ Expected number of artisanal fishermen using that gear in that period (known or subjective estimates).
- ❖ Fish transport performed by the same fishermen
- ❖ Complementary activity carried out by the above (boat/fishermen)
- ❖ Associated in cooperative

For each of the above items, whenever applicable, a description or comments were required. (Description or comments were to be given in a separate file, mainly reporting on details about gear used, species and associated, fishing zones, months of activity, number of units and number of fishermen)

A photograph of the gear and the species was requested.

3.6 The spatial structure

A GIS application was developed in association with the database implementation. This was a tool complete with basic detailed maps and utilities representing graphical features in a spatial context, i.e., not related directly and solely to ports but to fishing areas, species and gear operating. This work had a limited GIS component that would enable the user to incorporate directly into a GIS package (ArcView® was selected for this exercise) the fishing grounds for different combinations of métiers/species directly from the database. Also, other associated information such as the existence of marine parks, other fisheries, other infrastructures could be added in sequence to the "case" in order to present a composite view in which the artisanal fishery operated. For this, new basic map(s) (grid) and a new script to display the results in ArcView® were developed.

Various attempts were tested to have a simple mapping system at the same time to identify and record on paper, memorize in the computer, allow aggregation and separation, and enable post-stratification of the elements. In this respect, it was decided to introduce an elementary grid system for the COPEMED area, which might be extended to all the Mediterranean Sea for application concerning artisanal fisheries.

The basic map extended from the coastline to a depth of 200-m isobaths, and contained all the fishing grounds included in such area. Because of the big differences in depth from zone to zone, an overlapping grid map was also generated extending from the coastline to the 12 nautical mile limit. Each cell of the grid was 2x2 minutes dimension (enough to locate specific artisanal fishing grounds) and had a unique identification code. The coding was constructed by associating the latitude coordinates of the lower left corner of each cell. In this way the user could easily identify a concrete cell and its code on a map. For example, if the cell coordinates were 2° 26' W 37°

12' N, the code would be W0226N3712. The west (W) or east (E) directions had to be specified in the code, since while N is constant, there are COPEMED areas that are located on both sides of the Greenwich meridian.

A set of cells could describe a fishing ground for a concrete métier-species. This set was considered as a special geozone in the database, not related to ports but to métiers.

The grid for the COPEMED area to 200 m depth has 30 782 cells and covers a surface of 330 815 km². The grid for the COPEMED area from the coastline to the 12 nautical mile line is now ready. It has 28 418 cells and covers a surface of 308 777 km². All this information is clearly and thoroughly discussed in the report prepared by the GIS developers J. Baro and J.M. Serna (see Appendix 3 – Bibliography).

3.7 The implementation process

In order to achieve the objectives, three groups were set up.

- ❖ Design, supervision and analysis group
- ❖ Field work and data collection group
- ❖ Data processing and GIS group

The three groups did not work independently, but, vice versa, they all participated in the whole work bringing their own expertise and experiences.

The design, supervision and analysis group was concentrated in the FAO headquarters Fisheries Department. The list of participants and their involvement is given in Appendix 1.

3.7.1 *The field work*

Regarding the field work undertaken in connection with the inventory of artisanal fisheries, three approaches were applied dictated by the facilities and resources available and accessible in the different countries. In countries where no statistical unit was present, or infrastructure available to conduct the survey, COPEMED directly supported the data collection system through the involvement of an expert visiting the country, and conducting the survey with the national staff. Where the infrastructure existed but there were budgetary limitations, the project supported the costs related to staff mobility, computers, etc.

It was also agreed that for those countries where data existed, but which were not fully compatible, or had not been updated or were missing some characteristics, the project would support the cost of updating, standardizing and integration of the results into the ArtFiMed system. The field work data collection group consisted of six consultants recruited purposely. Each covered one country (or part of it) and prepared a detailed report on the field activity that should be consulted to get the direct outline of the work undertaken.

The COPEMED consultants who took part in the field activities were: Mr Alain Damiano, ORSTOM; Ms Géraldine Criquet supported by IFREMER (Sete); Mr Francesco Colloca, University of Rome – La Sapienza; Mr Leonardo Cannizzaro, IRMA – Mazara del Vallo; Mr Ignacio de Leiva Moreno, COPEMED; Mr M.J. Alarcón, COPEMED; Mr Valerio Crespi, COPEMED; Mr Michel Lamboeuf, COPEMED.

3.8 The data processing tools

This task was split into more than one activity. To avoid losing the positive momentum generated by the Malta workshop a quick “spreadsheet workbook” approach was immediately developed and the field work started in some countries. Its purpose was twofold - to start the data collection, and use it as a pilot study to better design the database with real information gathered in the field. While data collection was already under way and colleagues were working, another team developed the preliminary version of the database.

The database was afterwards provided with tools to regularly and automatically update the artisanal fishery CD-ROM for the presentation of national and regional results using normal browsers. The database description and the CD-ROM structure and functioning are described in other documents.

3.8.1 ArtFiMed database

The data collection system architecture construction was developed taking into account the nature of the data, their origin, dynamicity and so on. The “ArtFiMed” database was firstly constructed around such a model and made available to all parties concerned.

It was designed by the author of this paper and developed at the Instituto Español de Oceanografía (IEO) in Fuengirola, Malaga, by Jorge Baro and José Miguel Serna. Once it was ready, all data collected and stored in the Excel datasheets were downloaded into the database, which was then used for data entry and for all other built-in functions. After heavy utilization by different users, the system was then finalized in Rome (by M. Spinelli, FIRM) who also incorporated some other tools and routines developed by J. Baro and J.M. Serna, F. Ramos, A. Bensch, as well as by himself.

3.8.2 The CD-ROM builder (Janus tool)

It was believed that more knowledge, and specifically results from studies based on actual situations, could help to visualize the changes, to highlight similarities and dissimilarities, to interpret the evolution.

Raw data, collected within a statistical programme, needed to be elaborated in order to be usable as appropriate. The more the elaboration results are precise, complete, pertinent, timely and updateable by the users, the better they will be appreciated and used, both in terms of interest generated and people involved. From a conceptual point of view, the analytical approaches, provided that the processing scheme (logical and mechanical) is known and valid, that the data elements are adequately structured, and if we are dealing with the same type of data (numerical, descriptive, pictorial, or other), are not complicated.

The uncertainty arises when we need to process and present different types of data within the same “problem” and intend to reach many end-users of different levels and skills, interest and functions. In other words, we need complex summaries integrating and describing statistical results mixed with charts and graphics, maps and pictures, descriptions, tendencies, etc., easy to read, interpret, distribute and be updated. Among many solutions, converting the whole into HTML (*hypertext markup language*) format to be browsed afterwards in synthesized way was definitely considered the most appropriate. However, revision would not be a simple task in this solution.

Developing a high-quality hand-made CD-ROM to browse the contents of the survey and show the results of the processing focusing on various situations and scenarios would have served very well but only for a limited period of time.

A CD-ROM model architecture was also developed taking into account the end-users' requirements, the mass and type of data, the frequency of updating, the coverage, etc. The whole architecture was built around three blocks constituting the CD-backbone (static), the data cruncher (dynamic) and the CD-builder, respectively.

The static part of this architecture (the backbone) was the first to be defined, finalized and safeguarded (logos, map contours, indexes, radio buttons, texts, captions, etc.). Additional material was extracted from the database in a structured way making use of rigid standards and a strict directory system for subsidiary data.

Results from the routine processing and analysis were memorized according to the nature of the process needed, type of files, dates, areas, species, gear, etc. The "data cruncher" searched for data according to fixed models and/or a dynamically built model according to the situation. Comparative analyses were constructed and performed by fishery typologies and communities, on a national and regional basis and according to the availability of the data. For regional matching purposes, sometimes data was normalized and grouped into macro variables (seasons, gear, species groups, fishing zones).

The CD-builder constituted the "pride of the system". Tables, graphs, statistical routines, dynamic construction of sentences, estimates, shaping of maps and positioning of live points, tree-structured links and net connections were all generated dynamically by "Janus" software, using dynamic structures to be finally assembled in the CD-ROM.

The output is a CD-ROM containing updated results that can be produced at any time directly by qualified and authorized national users, by just running the "Janus" program interfaced to the "ArtFiMed" database.

This process is executed each time a new set of data is included in the system or when the database is updated with new data or edited. Each participating country (participating institutions) has a copy of its own database and update it if and when required. As far as the regional aggregation was concerned (and the subsequent production of the regional CD-ROM), only authorized COPEMED project staff can undertake this operation.

The regional version on CD-ROM is ready to be used and is available on the COPEMED Web site <http://www.faocopemed.org/vldocs/0001009/index.htm>.

3.8.3 The "Janus" interface

A two-way interface represented by the Roman mythological god "two-faced Janus" was developed specifically for this application. The tool is dual-faced, i.e., it has the CD-ROM on one side and the database on the other. In this context the database must be a census database or ArtFiMed.

Simply speaking, Janus reads, manipulates, crunches, archives, associates, etc., all the information according to a model, transforms it into HTML and replaces the old data with new ones.

In fact, in our model, Janus interacts indifferently from the ArtFiMed DataBase to the CD-ROM, or from the census database (GFCM-MedStat sample) to the ArtFiMed database and again to the CD-ROM.

It is expected that the extensive use of this tool (or methodology), would contribute to a better visual assessment of the changes of artisanal fishery communities or larger areas both at national and regional level. A comparative analysis between different artisanal fishery data domains, by year and by country, could also serve as a prototype for these communities management.

3.9 Outputs from this component

The main output of this work has been the elaboration of a comprehensive inventory of all the artisanal fishery communities present in the Western and Central Mediterranean, including GIS maps showing their distribution and a description of the main fisheries. The overall tangible output can broadly be summarized as follows:

All information provided by the countries has been assembled in a relational database and each country provided with its own segment.

- ❖ On request, a new subset of the related database can be provided to the responsible institutions concerned so that they can maintain their database, enter new data or perform their own analysis.
- ❖ The inventory of artisanal fisheries communities in the western central Mediterranean to be assessed and browsed.
- ❖ Establishment of a system of data collection for artisanal fisheries data in each member country.
- ❖ Preparation of an exhaustive bibliography on this subject.
- ❖ A computerized tool to produce regional aggregations, national and regional preliminary analysis and organize the results into a CD-ROM for browsing and consulting. This tool enables updating national and regional CD-ROMs at any time, after any updating and data modifications, without external assistance.
- ❖ Automated production by the COPEMED project of a CD-ROM/GIS atlas type containing all the information gathered, classified according to a given structure. Among other things, this CD-ROM is structured to allow posting all the revisions the users will incorporate in the future.

The relational database is linked to a GIS application to provide a spatial vision of the data, hence constituting a very useful tool to manage the fishery. ArcView® has been used as a background tool to exploit this application.

Scientists from participating countries had received training on ArcView®, and all the institutions participating had received a free copy of ArcView®.

Countries were also provided with the freeware version, ArcExplorer®, that would enable them to easily visualize the results, distribute the product internally and externally to their institution.

The results are intended to be used as a base book on the traditional fishing sector for future studies.

3.9.1 Results

The overall programme of work anticipated a certain number of tasks to be implemented in sequence (See: 3.1 – [The programme of work](#)). Till now tasks (a) through (e) and, partially, (f) have been achieved and therefore results can only be limited to completed tasks.

In the first instance, it was intended to publish the preliminary results on electronic support with, perhaps, some paper output of summaries. In this way we had hoped to supply a fresh product, at

low cost and hopefully with a wide distribution. We were confident that the more the information "travelled" the better would be the understanding of this work, which also means support.

This document (complemented by the CD-ROM) has been elaborated to cope with a list of artisanal fishing carried out in the western central Mediterranean, maps showing its distribution, and a description of the main fisheries. This work has also been published in electronic format and would, hopefully, be used as a reference for future research on traditional fishing in the Mediterranean.

The published CD-ROM includes the following chapters:

- ❖ The bibliography (may be in the form of a "virtual library");
- ❖ On request, and limited to the participating institutions, the national database in "open format" (Read/Write access) with all the data management functions;
- ❖ The browser accessing regional and national databases in "Read Only";
- ❖ A built-in navigating tool to process and view original and processed data contained in the database;
- ❖ A library of GIS maps and scenarios already developed and ready to use;
- ❖ The documentation related to this activity;
- ❖ Results of the two case studies already conducted in the Nador lagoon (Morocco) and in the Cilento (Italy).
- ❖ Ideas and possible subjects on which to construct potential applications based on this work (preliminary case studies);
- ❖ Activity reports that have generated this work.

3.9.2 Final results

As previously mentioned, when programmed, this project activity considered about eight tasks to be undertaken. They were labeled from (a) through (i). Tasks (a) through (e) and partially (f) have been accomplished. Unfortunately it was not possible to fully extend the programme of work to cover also point (g) "*Definition of a research programme for the execution of detailed pilot studies in well-delimited zones, the results of which could serve as a relevant model for other zones*" and point (h) "*Setting up and execution of pilot studies intending to define fisheries management strategies of this sector for the benefit of those parties involved in the fishing sector and in the administration*". The follow-up was limited to two case studies and their results are published in separate papers.

The final step (point "i") of the original programme or work could not be undertaken because it had to consider the analytical results of all other previous activities not implemented and present the overall work and critically comment on the propositions. The two case studies implemented were not considered sufficient to present a comprehensive view from which decisions could be taken. Proposals related to the Nador lagoon and to the Cilento area can be found in "Colloca, F., Crespi, V., Cerasi, S., Coppola, S.R. Evolution of the Artisanal Fishery in Cilento, Italy – case study. FAO – COPEMED, Rome, May 2003" and "Malouli Idrissi, M., Houssa, R. Etude intégrée de la pêche artisanale dans la lagune de Nador. FAO – COPEMED, Nador – May 2003".

The idea was to incorporate all the results obtained during each step into a comprehensive report with supporting socioeconomic interactions published in hyper textual mode, using Internet browsers to help the user navigate through the system as a Decision Support Tool.

However, based on the amount of work done and the results so far achieved and, mainly considering the positive reactions from all the participating country institutions to the work

accomplished, it is hoped that a follow-up to this application, possibly not limited to the COPEMED area, could be envisaged.

3.10 Synergies with other activities in the Project

At the time of this inventory, the COPEMED project was undertaking parallel activities dealing with GIS application but not yet in the socio-economic sector. Should this exercise be expanded or further developed, it was strongly recommended that the objectives, the methodology adopted and the expected results would, in the future, be part of a wider operation. This argument should not be limited to activities within the COPEMED project, but also in connection to other subregional projects in the region. It must be stressed that the joint action of expertise from different and complementary disciplines has added value to the present results.

4. THE STATUS OF THE COLLECTED INFORMATION BY COUNTRY

4.1 The fieldwork was conducted in all countries with a different degree of coverage

Algeria

The data collection process was presented and explained; data collection started early January 2001. The field work was completed in 2003. (Sahi Mohand Akli et Bouaicha Mohamed. La pêche artisanale en Algérie. COPEMED, Algiers – May 2003)

France

The data collection for métiers was completed for the entire coastline. Data for the Languedoc-Roussillon area, up to Marseilles, were collected in a first run, the remainder was completed after a year. The geographical data set had some gaps. (Guillou, A., Crespi, V. 1999. Frame survey on the distribution, composition and activity of the Gulf of Lions small-scale fishing fleet.)

Italy

Basic data on port fleet consistency were available, but were not detailed enough to be used for this task. Data from the Cilento area were complete and well refined. Some data for Sicily were also available. (Colloca, F. 1999. COPEMED Project - Work Report: Artisanal fisheries in the western Mediterranean – Italy (October-December 1998/April-June 1999))

Libyan Arab Jamahirija

The database was complete, as were also the geographical data. Métiers attributes were missing in the database but the information was contained in the descriptive files of the métiers and ports. The task force staff tried to extract elementary data from the descriptions (narrative). (Lamboeuf, M., 2000. Artisanal Fisheries in Libya – Census of Fishing Vessels and Inventory of Artisanal Fishery Métiers. COPEMED Project).

Malta

Work was completed and allowed for integration into the general database. However a few descriptions and photos were still missing. (De Leiva, J.I., Busuttil, C., Darmanin, M., Camilleri, M. Malta Fisheries. COPEMED Project).

Morocco

In Morocco, the coverage was complete. Geographical data were initially missing, but finally they were entered in Rome using ArcView®. (Damiano, A. 1999. Appui pour la réalisation d'un recensement sur la pêche artisanale en Méditerranée marocaine. COPEMED Project).

Spain

The data collection for métiers was completed for the entire coastline. Regarding geographical data, after the completion of the Baleares, Murcia, Andalousia and Catalunia were completed. However a few descriptions and photos were still missing. (Alarcón J.A.U. 2001. Inventario de la Pesca Artesanal en España Mediterránea (2000–2001). COPEMED Project.)

Tunisia

The field work in Tunisia was implemented in two steps. In February 2002 the whole work was completed. (Ben Moussa, Hedi. La Pêche Artisanale en Tunisie. COPEMED, Tunis – May 2003.)

4.2 Ports with artisanal fishery operations

One of the first achievements of this work was a comprehensive list of ports with geographic references for all ports in the COPEMED area where artisanal communities performed their activity. In Appendix 2 the ports are listed country by country.

4.3 Regional standardization /grouping

In order to compare national data on a regional scale some post stratification and classification were needed. They were built after having treated all the elementary artisanal fishery records for each of the variables that needed to be grouped. A computer model was also developed in order to enable grouping for future entries. The groupings were made by associating métiers performing the same activity using its variable as the control characteristic (i.e., when using the activity pattern (seasons) the “months” variable is used to group observations with identical remaining parameters (target species, gear, fishing zone)). In the CD-ROM presentation, the aggregation pattern of all the main characteristics is given in full. In summary, they are the following:

4.3.1 Fishing seasons

Standard fishing seasons were introduced by logically grouping similar activities performed by the same fleet during the reported time period.

It was also assumed that if an activity was performed for more than eight consecutive months, it could be considered as “all year round”. Elementary seasons of two consecutive months were artificially created. This was needed to avoid the same activity (target species, gear, fishing zone) reported as having been performed in June, being considered differently to a similar one covering a period of June-July. The seasonal combinations and the associated keywords are reported in Table 4.3.1.a. Table 4.3.1b shows an example of how working months were grouped to form seasonal combinations.

Table 4.3.1a – Seasonal combinations

Reported fishing seasons	Standard seasons
Only winter	Winter
Only spring	Spring
Only summer	Summer
Only autumn	Autumn
Winter and spring or part of it	Winter-spring
Winter and summer or part of it	Winter-summer
Spring and summer or part of it	Spring-summer
Autumn and winter or part of it	Autumn-winter
Spring and autumn or part of it	Spring-autumn
Summer and autumn or part of it	Summer-autumn
Three seasons	All seasons

Table 4.3.1b – Example of working months' aggregations in seasonal combinations

Season	Winter	Spring	Summer	Autumn	Standard season
111111110000	Activity	Activity	Activity	No activity	All season – 8 months
1100000000000	Activity	No activity	No activity	No activity	Winter
001100000000	Activity	Activity	No activity	No activity	Winter-spring
000111111100	No activity	Activity	Activity	Activity	All seasons –3 seasons
000011111000	No activity	No activity	Activity	No activity	Summer
110000000111	Activity	No activity	No activity	Activity	Autumn-winter
000100000000	No activity	Activity	No activity	No activity	Spring

4.3.2 Fishing zones

Fishing zones were grouped into four main classes. In Table 4.3.2 the standardized fishing zones are reported as also their descriptions.

Table 4.3.2 – Standardized fishing zones

Standard fishing zones	Range	or	or	or
Coastal waters	All depths <=50	Min <=25 and Max <=55	Min <=20 and Max <=60	Min <=10 and Max <=75
Medium range	Max-Min < 100	Min >25 and Max <=55	Min >20 and Max <=60	Min >10 and Max <=75
Deep waters	All depths >150	Min >100 and Max >250		
Wide range	All the others			

4.3.3 Species

The species or group of species (accessory or target) were grouped into **main families** using the scientific name of the family.

4.3.4 Gear

Fishing gears were standardized by grouping them into main categories, following the FAO classification. (FAO Fisheries Technical Paper No. 222. Rev.1, Rome 1990).

5. PRELIMINARY STATISTICAL ESTIMATES

In presenting some preliminary results, it must be stressed that these are partial and reflect only data that are actually in the data base.

While they were based on more than 13 000 elementary artisanal fishery records, which was probably the highest number ever analyzed simultaneously, they cannot be considered as final. In fact, for some cases (take the observation distribution by country, for example) they represented a very good sample and reflected the situation satisfactorily; in others they were less representative. However, it is worth issuing some results that may certainly help in describing the artisanal fishery.

5.1 The data source

The data on the artisanal fishing sector in the Mediterranean Sea was collected in a data bank called “ArtFiMed”, which is composed of 13 582 records. Each record contains all the items related to one elementary artisanal fishery unit. It is split up into eight countries (see Table 5.1). Most records hold data for Libyan A.J. (25.7%), Spain (17.4 %), France (15.6%) and Tunisia (14.7%). In fact, these represent 73.4% of the total data. These figures show that artisanal fishery has a different weight country by country. This data bank contains 31 fields (see Table 5.2).

It must be stressed that these preliminary estimates come from an inventory and from partial coverage. They should be used accordingly.

Table 5.1 – Number of records by countries

Countries	No. of records	%
Libyan Arab Jamahirija	3 488	25.7
Spain	2 361	17.4
France	2 121	15.6
Tunisia	2 002	14.7
Morocco	1 402	10.3
Algeria	1 265	9.3
Malta	609	4.5
Italy	334	2.5
Total	13 582	100

Source: FAO-ArtFiMed 2000–2003

5.2 The consistency of the databank

The inventory of the artisanal fishery communities in the western central Mediterranean produced a databank containing 13 582 records (elementary artisanal fishery unit = a community in a port fishing with a given gear, targeting a species or group of species in a fishing zone within a certain time period). In Table 5.1 the national distribution is given (absolute and percentage).

The analysis of “métier”, which corresponds to a combination of gears, target species, geographic fishing zone and also the period of the year during which the “métier” is practised (fishing season) is consistent in terms of number of records without missing values (see Table 5.2).

Table 5.2 – Consistency of variables

Variable	Valid cases	%	Missing data	%
COMMAT	19	0.1	13 563	99.9
DEPTHMAX	13 322	98.1	260	1.9
DEPTHMIN	13 340	98.2	242	1.8
DESCRIPT (description)	9 716	71.5	3 866	28.5
FAMILY	13 582	100	0	0

5.3 Gear composition

The most important gears for artisanal fishery in the western central Mediterranean (Algeria, France, Italy, Libyan A.J., Malta, Morocco, Spain and Tunisia) are “gillnets and entangling nets”; in fact they represent 54.9% of total gear utilized, followed by “hooks and lines” with 32.8%.

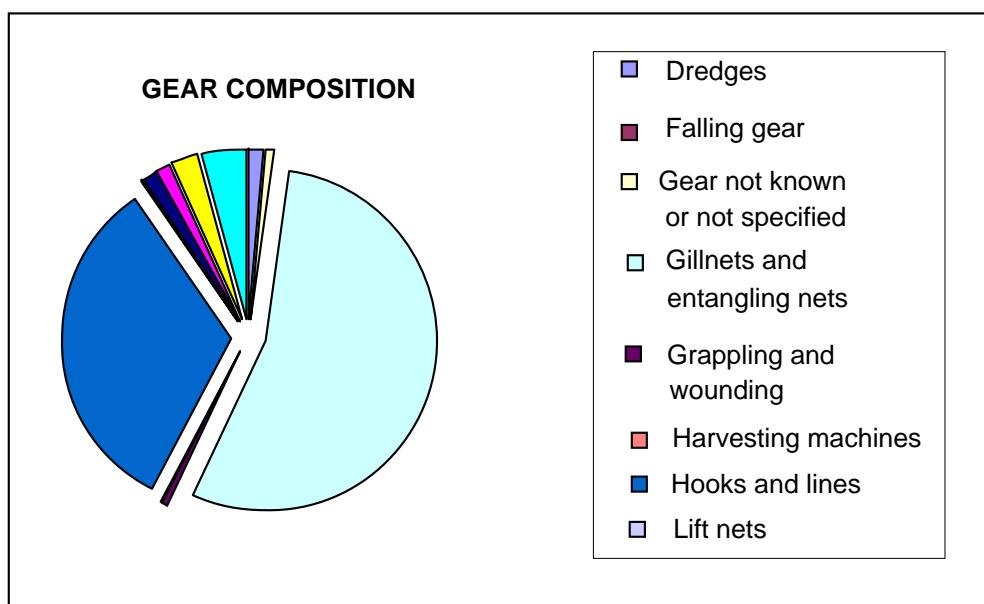

The remaining part is constituted by “traps” (4.2%), “surrounding nets” (2.5%), “seine nets” (1.5%), “dredges” (1.7%), “miscellaneous gear” (1.3), “grappling and wounding” (0.4%), “lift nets” (0.3%) and “harvesting machines” (0.1). 0.4% of gear is not known or not specified (see Table 5.3 and Fig. 1).

Table 5.3 – Gear composition

Fig.1 – Artisanal fishery in the Western and Central Mediterranean – Gear composition

5.4 Species and catch composition

Most fish caught by fishermen come from associated species and other commercial species (53.5%), while only 46.5% of the fish derive from species specifically targeted (see Table 5.4a). Typically this sector consists of part-time, subsistence, and small-scale commercial fisheries that use multiple fishing technologies and target multiple species. Artisanal fishery continues to use a wide variety of fishing technologies and methods and to target diverse species.

Table 5.4a – Species or species group targeted by the fishermen

Species	Frequency	%
Accessory	7 264	53.5
Target	6 318	46.5
Total	13 582	100

Source: FAO–ArtFiMed 2000–2003

On the subregional basis, Sparidae are the most important species caught (31%), followed by Serranidae (6.3%), Scombridae (5.9%), Carangidae (5.8%), Mullidae (5.4%), Sepidae (4.9%), Scorpaenidae (4.6%) and many other species (see Table 5.4b).

The **Sparidae** family contains a large number of species: *Archosargus*, *Boops*, *Calamus*, *Chrysophrys*, *Dentex*, *Diplodus*, *Lagodon*, *Pagellus*, *Pagrus*, *Pimelepterus*, *Rhabdosargus*, *Sparus*, *Stenotomus*.

5.5 Fishing zone

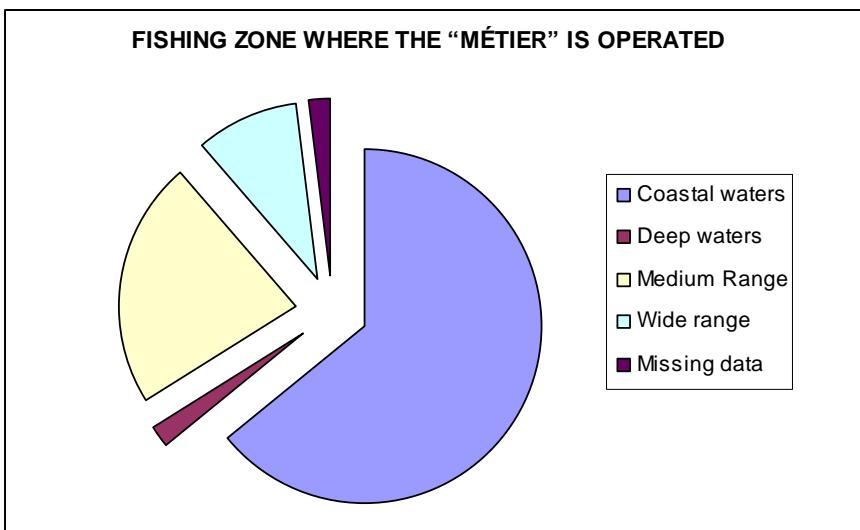

The main zone where the fishermen catch is coastal water (64.3%) or medium range waters (22.3%). The amount of missing data is not so relevant (1.9%). (See Table 5.5 and Fig.2).

Table 5.5 – Type of fishing zone where the “métier” is operated

Type of fishing zones	Frequency	%
Coastal waters	8 732	64.3
Deep waters	259	1.9

**Fig. 2 – Artisanal fishery in the Western and Central Mediterranean
Operational fishing zones**

5.6 Fishing activity

Artisanal fishermen fish throughout the year. In fact more than half of them (54.4%) reported no interruptions in their activity. Also, long-term activities are practised (two successive seasons), for example spring-summer (13%), autumn-winter (6.8%). (See Table 5.6 and Fig.3).

5.7 Fishermen composition

This type of fishery is characterized by a low number of fishermen and boats per métier (see Tables 5.7a and 5.7b). In this specific case, an accurate analysis of the number of fishermen cannot be considered accurate here since this item of information was descriptive and not punctual and numeric.

Table 5.7a – Number of fishermen per métier

Fishermen (occurrences) reported	Frequency	%
Missing data	1 925	14.2
From 1 to 3	1 327	9.8
From 4 to 6	1 460	10.7
From 7 to 15	2 778	20.5

5.8 Matching results between countries

5.8.1 General

Based on the available data in Algeria, France, Italy, Libyan A.J., Spain and Tunisia “gillnets and entangling nets” are the most used gear; while in Malta and Morocco the most used gear are “hooks and lines” (see Tables 5.8.1a and 5.8.1b).

Table 5.8.1a – Gear composition by country

Source: ArtFiMed 2000–2003

In all countries except Malta, fishermen reported catching associated species rather than target species (see Tables 5.8.1c and 5.8.1d). Sparidae is the most important family caught by artisanal fishermen in all countries (31% of the total) except in Italy where Scombridae is the first family (13.8%). The second family differs country by country: Sepiidae in Spain (7.5%), Labridae in France (8.1%), Sparidae in Italy (10.2%), Scombridae in Morocco (9.2%), Serranidae in Libyan

A.J. (13.9%), Carangidae in Malta (12.3%) and in Algeria (9.2%), and finally Scorpaenidae in Tunisia (8.2%) (see Tables 5.8.1e and 5.8.1f).

The main zone where the fishermen catch is coastal water (64.3%) or medium range waters (22.3%). Differences between countries are negligible (See Tables 5.8.1g and 5.8.1h). The differences between seasonal activities are also negligible (See Tables 5.8.1i and 5.8.1l)

6. CASE STUDIES

Once the preliminary part had been completed, the programme made a big change in its activity: it passed from a qualitative and generic inventory to punctual and precise studies to be implemented where the experimental conditions enabled in-depth and detailed data collection.

The first case study, which should in any case be proposed in countries where this is a standing issue, was the assessment of the weight in terms of fleet, catch, effort and value of the artisanal fishery.

Some proposals came out of the meeting in Monastir, Tunisia (May, 1999) from the country experts. The participants had been asked to form groups and prepare a theoretical case analysis. The subjects for these case analyses were chosen by the participants. The following case studies were worked out:

- ❖ Evolution of a given métier
- ❖ Prospectives of integration and diversification of the artisanal fishery in the region
- ❖ Interactions between artisanal fisheries métiers and the interaction between artisanal and industrial fisheries

The final decision on the case studies was taken at the meeting dealing with the end of the inventory phase, where the results so far achieved were presented and commented. At that moment the country experts knew on which data and information they could count, and had a clear idea of the distribution pattern of the artisanal fishery communities, their concentrations, the composition, the importance, similarities, etc.

In order to expedite implementation of the programme, two case studies were assigned: one in south Italy and one in Morocco (Nador). They were published in a specific issue of the series *Informes y Estudios COPEMED* nº 10. (Colloca *et al.*, 2003) published in September 2003.

6.1 Artisanal fishery in the Cilento area (southern Tyrrhenian Sea), Coordinator: Francesco Colloca (with Crespi, V., Cerasi, S. and Coppola, S.R.)

Objectives:

The general objective of the study was to identify management/co-management strategies in artisanal fishery, which could be used as a guide in other Italian/Mediterranean coastal areas. Data collection routines on both fishery activity and coastal zone based activities were developed for this purpose.

The outputs of the study were the following:

- ❖ analysis of the evolution of the artisanal fishery during the last ten years through comparison of old (1994–95) and new quantitative data on fishery components;
- ❖ distribution analysis of the fishing effort in the coastal zone;
- ❖ socio-economic changes which had affected the traditional fishing activities;
- ❖ analysis of factors involved in the observed processes;
- ❖ hypothesis testing, studies of issues related to processing and management systems.

6.2 Integrated Study of artisanal fisheries in the Nador lagoon, by Malouli Idrissi, M. and Houssa Rachida. (original title : Etude intégrée de la pêche artisanale dans la lagune de Nador, par Malouli Idrissi, M. et Houssa Rachida)

Objectives:

- ❖ Estimate of the global fishing effort.
- ❖ Estimate of the catch per effort unit and of the lagoon's global catch.
- ❖ Assessment of the socio-economic features.
- ❖ Use of the GIS tool for mapping the fishing effort, the catch per surface unit, the total catch and the socio-economic features.
- ❖ Spatial analysis of the interaction between the different mapping parameters.
- ❖ Identification and economic assessment of the train chain fishery products.
- ❖ Identification of constraints for the industry and possible solutions.

For more information on the two case studies, the document is available upon request to COPEMED and in PDF format at: <http://www.faocopemed.org>

APPENDIX 4

Species caught by artisanal fishery and their national names

Scientific Name	English	French	Spanish	Algerian	Italian	Libyan	Maltese	Moroccan	Tunisian
<i>Abralia veranyi</i>	Verany's enope squid	Encornet de Verany	Enoploloria de Verany					<i>Abralia veranyi</i>	
<i>Acanthocardia tuberculata</i>	Tuberculate cockle	Bucarde tuberculée	Corruco						
<i>Alopias vulpinus</i>	Thresher shark	Renard	Zorro	Requin renard	Pesce volpe		Budenb	<i>Alopias vulpinus</i>	Requin renard
<i>Alosa alosa</i>	Allis shad	Alose vraie	Sábalo común	Chbouka	Alosa	Loza	Lacca	Alose	Chbouka
<i>Anguilla anguilla</i>	European eel	Anguille d'Europe	Anguila europea	Anguille	Anguilla	Anguila	Sallura		Anguille
<i>Aphia minuta</i>	Transparent goby	Nonnat	Chanquete	Nonnat	Rossetto	Abokehash	Makku		Nonnat
<i>Aristeus antennatus</i>	Blue and red shrimp	Crevette rouge	Gamba rosada		Gambero viola			<i>Aristeus antennatus</i>	
<i>Aspitrigla cuculus</i>	Red gurnard	Grondin rouge	Arete		Capone imperiale	Djaj	Zumbrell ghadma		
<i>Atherina boyeri</i>	Big-scale sand smelt	Joel	Pejerrey	Atherine	Latterino copoccione	Wazef	Kurunella ghajnejh kbar		Atherine
<i>Auxis rochei</i>	Bullet tuna	Bonitou	Melva	Melva	Bonito	Matseti	Tumbrell		Melva
<i>Auxis thazard</i>	Frigate tuna	Auxide	Melva		Tombarello		Tumbrelli	<i>Auxis thazard</i>	
<i>Balistes carolinensis</i>	Grey triggerfish	Baliste-cabri	Pez ballesta	Cochon de mer	Pesce Balestra	Hallouf	Hallouf		Cochon de mer
<i>Belone belone</i>	Garfish	Orphie	Aguja	Aiguille	Auguglia	Yebrah	Imsella		Aiguille
<i>Bolinus brandaris</i>	Purple dye murex	Murex-droite épine	Cañailla		Sconiglio			<i>Bolinus brandaris</i>	
<i>Boops boops</i>	Bogue	Bogue	Boga	Bouga	Boga	Boga	Vopa	Bogue	Bouga
<i>Bothus podas</i>	Wide-eyed flounder	Rombou podas	Podas	Rumbo	Rombo d'arena		Barbun ghajnejh imbegħda		
<i>Brama brama</i>	Atlantic pomfret	Grande castagnole	Japuta		Pesce castagna	unknown	Pixxiluna		
<i>Callista chione</i>	Smooth callista	Vernis fauve	Almejón		Fasolara				
<i>Campogramma glaycos</i>	Vadigo	Liche lirio	Lirio		Cerviola imperiali		Serra		
<i>Caranx cryos</i>	Blue runner	Carangue coubali	Jurel azul		Carango mediterraneo	Sawro imriali	Sawrella imperjali denħha iswed		
<i>Caranx rhonchus</i>	False scad	Comète coussut	Jurel real		Carango Ronco			<i>Caranx rhonchus</i>	
<i>Carcharhinus plumbeus</i>	Sandbar shark	Requin gris	Tiburón trozo	Requin gris	Squalo grigio	Kalb baher	Kelb gris	Lkars	Requin gris
<i>Carcinus aestuarii</i>	Mediterranean shore crab	Crabe vert de la Méditerranée	Cangrejo mediterráneo		Granchio da moleca				
<i>Carcinus maenas</i>	Green crab	Crabe vert	Cangrejo verde		Granchio verde europeo				
<i>Cerastoderma edule</i>	Common edible cockle	Coque commune	Berberecho comun		Cuore				
<i>Chamelea gallina</i>	Striped venus	Petite praire	Chirla						

Scientific Name	English	French	Spanish	Algerian	Italian	Libyan	Maltese	Moroccan	Tunisian
Cheilopogon heterurus	Mediterranean flyingfish	Exocet méditerranéen	Juriola	Exocet méditerranéen			Rondinella komuni		
Citharus linguatula	Spotted flounder	Feuille	Solleta				Lingwata tal-qxur kbar	Citharus linguatula	
Conger conger	European conger	Congre d'Europe	Congrio común	Congre	Grongo	Gringu	Gringu		Congre
Corallium rubrum	Sardinia coral	Corail Sardaigne	Coral Cerdeña						
Coris julis	Rainbow wrasse	Girelle	Julia	Demoiselle	Donzella		Gharusa	Coris julis	Demoiselle
Coryphaena hippurus	Common dolphinfish	Coryphène commune	Lampuga	Coryphène	Lampuga	Lambuka	Lampuka		Coryphène
Dasyatis pastinaca	Common stingray	Pastenague commune	Raya látigo común	Pastenague commune	Pastinaca	Bugrah bahar	Boll komuni		Pastenague commune
Dasyatis tortonesi	Tortonese's stingray	Pastenague de tortonese	Raya látigo de tortonese						
Dentex dentex	Common dentex	Denté commun	Denton	Dendik	Dentice	Dentichi	Dentici	Sabia	Dendik
Dentex gibbosus	Pink dentex	Gros denté rose	Sama de pluma	Dendik	Dentice corazziere	Joghali	Hajwat	Pageot	Dendik
Dicentrarchus labrax	European seabass	Bar européen	Lubina	Bar européen	Branzino	Garous	Spnotta		Bar européen
Dicentrarchus punctatus	Spotted seabass	Bar tacheté	Baila		Spigola macchiata	Garous mnaghet	Spnotta tat-tbajja		
Diplodus annularis	Annular seabream	Sparaillon commun	Raspallón	Sbares	(Spareto) Sarago Sparaglione	Sbarus	Sparlu	Sparaillon	Sbares
Diplodus cervinus	Zebra seabream	Sar à grosses lèvres	Sargo breado	Sar	Sarago faraone				
Diplodus puntazzo	Sharpsnout seabream	Sar à museau pointu	Sargo picudo	Sar	Sarago pizzuto			Diplodus puntazzo	Sar
Diplodus sargus	White seabream	Sar commun	Sargo	Sar	Sarago maggiore		Sargi	Diplodus sargus	Sar
Diplodus vulgaris	Common two-banded seabream	Sar à tête noire	Sargo mojarra	Sherdou	Sarago fasciato	Garagous mwashim	Xirgien	Haddad	Sherdou
Donax trunculus	Truncate donax	Flion tronqué	Coquina	Flion tronque	Tellina				Flion tronque
Echiichthys vipera	Lesser weever	Petite vive	Salvariego	Araignée			Sawt		Araignée
Eledone cirrhosa	Horned octopus	Poulpe blanc	Pulpo blanco		Moscardino bianco			Eledone cirrhosa	
Engraulis encrasicolus	European anchovy	Anchois commun	Boquerón	Anchouwa	Alice	Anshoga	Incova	Chtoun	
Epinephelus aeneus	White grouper	Mérou blanc	Cherne de ley	Mérou blanc	Cernia bronzina	Mennani	Dott tal-faxxi		Mérou blanc
Epinephelus alexandrinus	Golden grouper	Mérou badèche	Falso abadejo	Badèche	Cernia dorata			Epinephelus alexandrinus	Badèche
Epinephelus caninus	Dogtooth grouper	Mérou gris	Cherne dentón	Mérou noir	Cernia near	Khanzirah	Dott abjad		Mérou noir
Epinephelus costae	Gold blotch grouper	Mérou badèche	Falso abadejo		Cernia dorata	Dooth			
Epinephelus guaza	Dusky grouper	Mérou noir	Mero		Cernia bruna	Farouj	Cerna		
Epinephelus haifensis	Haifa grouper	Mérou d'Haifa	Mero de Haifa			Khanzirah soda			
Etmopterus spinax	Velvet belly	Sagre commun	Negrito	Sagre common	Pesce diavolo		Mazzola tal-fanal	Etmopterus spinax	Sagre common
Euthynnus alletteratus	Little tunny	Thonine commune	Bacoreta	R'zem	Tonnetto	Rzam	Kubrita	Lbakoura	R'zem
Gadiculus argenteus	Silvery pout	Merlan argenté	Faneca plateada		Pesce fico		Nemusa		
Galeorhinus galeus	Tope shark	Requin-hâ	Cazón	Requin ha	Canesca		Mazzola	Galeorhinus galeus	Requin ha

Scientific Name	English	French	Spanish	Algerian	Italian	Libyan	Maltese	Moroccan	Tunisian
<i>Galeus melastomus</i>	Blackmouth catshark	Chien spagnol	Pintarroja bocanegra	Chien espagnol	Boccanera		Gattarell halqu iswed	Galeus melastomus	Chien espagnol
<i>Gobius niger</i>	Black goby	Gobie noir	Chaparrudo	Gobie	Ghiozzo nero		Mazzun iswed	Gobius niger	Gobie
<i>Gobius paganellus</i>	Rock goby	Gobie paganel	Bobí	Gobie paganel	Ghiozzo paganello		Mazzun tal-port		Gobie paganel
<i>Gymnammodytes cicerellus</i>	Mediterranean sand eel	Cicerelle	Barrinaire		Cicerello	Djaj	Ciccirella		
<i>Gymnothorax unicolor</i>	Brown moray	Murène brune	Morena negra	Mrina			Morina kannella		Mrina
<i>Helicolenus dactylopterus</i>	Rockfish	Rascasse de fond	Gallineta	Rascasse	Scorfano di fondale	Shkorfo	Cippullazza ta' l'ghajn		Rascasse
<i>Heptranchias perlo</i>	Sharpnose sevengill shark	Requin-perlon	Cañabota bocadulce	Kelb bhar	Squalo manzo	Kalb baher	Murruna	Kalb	Kelb bhar
<i>Hippospongia communis</i>	Honey comb	Eponge commune	Esponja común						
<i>Hirundichthys rondeletii</i>	Blackwing flyingfish	Exocet-ailes noires	Volador aleta negra	Khottaifa			Rondinella rara		Khottaifa
<i>Homarus gammarus</i>	European lobster	Homard européen	Bogavante	Hommard	Astice		Ljunfant	Hommarus gammarus	Hommard
<i>Illex coindetii</i>	Broadtail squid	Encornet rouge	Pota voladora		Totano			Illex coindetii	
<i>Isurus oxyrinchus</i>	Shortfin mako	Taupe bleue	Marrajo dientuso	Taupe bleu	Squalo mako	Zergaya	Pixxitondu	Lkars	Taupe bleue
<i>Katsuwonus pelamis</i>	Skipjack tuna	Bonite à ventre rayé	Listado		Tonnetto striato		Palamit	Katsuwonus pelamis	
<i>Labrus bergylta</i>	Ballan wrasse	Vieille	Maragota		Tordo marvizzo				
<i>Labrus merula</i>	Brown wrasse	Merle	Merlo	Merle	Labride verde	Abukheder	Mirli		Merle
<i>Labrus viridis</i>	Green wrasse	Labre vert	Tordo	Labre vert	Tordo		Tirda	Labrus viridis	Labre vert
<i>Lamna nasus</i>	Porbeagle	Taupe commune	Marrajo sardinero	Taupe commune	Smeriglio	Zergaya	Pixxiplamtu	Lkars	Taupe commune
<i>Lepidopus caudatus</i>	Silver scabbardfish	Sabre argenté	Pez cinto	Sabre argente	Pesce sciabola	Semta	Fjamma		Sabre argenté
<i>Lichia amia</i>	Leerfish	Liche né-bé	Palometon	Chrab	Leccia amica	Strella	Serra	Liche	Chrab
<i>Lithognathus mormyrus</i>	Striped seabream	Marbré	Herrera	Menkous	Mormora	Mankus	Mingus	Rmouli	Menkous
<i>Liza aurata</i>	Golden grey mullet	Mulet doré	Galupe	Bourri	Muggine dorato	Bori	Mulett tac-carruta safra	Hanel	Bourri
<i>Liza ramada</i>	Thinlip mullet	Mulet-porc	Morragute	Mulet-porc	Muggine calamita	Bori	Mulett ta' l'imcarrat		Mulet-porc
<i>Liza saliens</i>	Leaping mullet	Mulet sauter	Galúa	Mulet sauteur	Muggine musino		Mulett buri	Liza saliens	Mulet sauteur
<i>Loligo vulgaris</i>	European squid	Encornet	Calamar		Calamaro commune		Klamari	Loligo vulgaris	
<i>Lophius budegassa</i>	Black-bellied angler	Baudroie rousse	Rape negro	Baudroie	Budego	Boshkara	Petrica zghira		Baudroie
<i>Lophius piscatorius</i>	Angler	Baudroie commune	Rape	Baudroie	Rana pescatrice	Boshkara	Petrici		Baudroie
<i>Macra corallina</i>	Rayed trough-shell	Mactre coralline	Pechina lisa						
<i>Macra glauca</i>	Grey rough shell	Mactre fauve	Pechina blanca						
<i>Merluccius merluccius</i>	European hake	Merlu commun	Merluza europea	Nasalli	Nasello / Merluzzo	Marlutso	Marloz		Nasalli
<i>Microcosmus sabatieri</i>	Sea fig	Figue de mer	Provecho					Microcosmus sabatieri	
<i>Micromesistius poutassou</i>	Blue whiting	Merlan bleu	Bacaladilla	Mernouze	Potassolo		Stokkafixx	Micromesistius poutassou	Mernouze

Scientific Name	English	French	Spanish	Algerian	Italian	Libyan	Maltese	Moroccan	Tunisian
<i>Mugil cephalus</i>	Flathead grey mullet	Mulet à grosse tête	Pardete	Mulet a grosse tête	Cefalo mazzone	Buri	Mulett ta' l'iswed		Mulet à grosse tête
<i>Mullus surmuletus</i>	Striped red mullet	Rouget-barbet de roche	Salmonete de roca	Rouget	Triglia di scoglio	Trelia hamra	Trilja tal-hama		Rouget
<i>Muraena helena</i>	Mediterranean moray	Murène de la Méditerranée	Morena	Murène	Murena	Zemrina	Morina		Murène
<i>Mustelus asterias</i>	Starry smoothhound	Emissole tachetée	Musola coronada	Ktat bou noqta	Palombostellato	Matsola	Mazzola tat-tbajja	Kalb	Ktat bou noqta
<i>Mustelus mustelus</i>	Smoothhound	Emissole lisse	Musola	Ktat	Palombo	Matsola	Massola blaxewka	Kalb il bahr	Ktat
<i>Myctoperca rubra</i>	Comb grouper	Mérou royal	Gitano		Cernia rossa	Dooth yahudi	Cerna denbha drift		
<i>Mytilus galloprovincialis</i>	Mediterranean mussel	Moule méditerranéenne	Mejillón mediterráneo	Moule	Cozza o Mitilo			Mytilus galloprovincialis	Moule
<i>Nassarius mutabilis</i>	Changeable nassa	Nasse-ceinture	Mugarida lisa						
<i>Naucrates ductor</i>	Pilot fish	Poisson-pilote	Pez piloto	Poisson pilote	Pesce pilota	Lalaja	Fanfru	Baghbagh	Poisson pilote
<i>Nephrops norvegicus</i>	Norway lobster	Langoustine	Cigala	Langoustine	Scampo		Ragustelli	Nephrops norvegicus	Langoustine
<i>Oblada melanura</i>	Saddled seabream	Oblade	Oblada	Kahlaya	Occhiata	Kahla	Kahlija	Kahla	Kahlaya
<i>Octopus salutii</i>	Spider octopus	Poulpe de Saluzzi	Pulpo arena					Octopus salutii	
<i>Octopus vulgaris</i>	Common octopus	Pieuvre	Pulpo común	Poulpe	Polpo commune			Octopus vulgaris	Poulpe
<i>Orcynopsis unicolor</i>	Plain bonito	Palomette	Tasarte	Bonite plate	Palamita bianca		Plamtu bla rigi	Orcynopsis unicolor	
<i>Ostrea edulis</i>	European flat oyster	Huître plate européenne	Ostra		Ostrica				
<i>Pagellus acarne</i>	Axillary seabream	Pageot acarné	Aligote	Morjane	Fragolino bastardo	Bazoka	Bazuga	Pageot	Morjane
<i>Pagellus bellottii</i>	Red pandora	Pageot à tache rouge	Breca chata						
<i>Pagellus bogaraveo</i>	Blackspot seabream	Dorade rose	Besugo	Morjane	Rovello	unknown	Bazuga	Pageot	Morjane
<i>Pagellus erythrinus</i>	Common pandora	Pageot commun	Breca	Morgen	Pagello	Morjan	Pagella hamra	Pageot rouge	Morgen
<i>Pagrus auriga</i>	Redbanded seabream	Page rayé	Hurta		Pagro reale		Pagru hamrani		
<i>Pagrus pagrus</i>	Common seabream	Page commun	Pargo	Pagre	Pagro		Pagli	Pagrus pagrus	Page
<i>Palaemon serratus</i>	Common prawn	Bouquet	Camarón común		Gamberetto				
<i>Palinurus elephas</i>	Common spiny lobster	Langouste rouge	Langosta común		Aragosta rossa		Awwista	Palinurus elephas	
<i>Palinurus mauritanicus</i>	Pink spiny lobster	Langouste rose	Langosta mora					Palinurus mauritanicus	
<i>Paracentrotus lividus</i>	Stony sea urchin	Oursin-pierre	Erizo de mar		Riccio				
<i>Parapenaeus longirostris</i>	Deep-water pink shrimp	Crevette rose du large	Gamba de altura	Crevette rose	Gambero rosa		Gambli bojad	Parapenaeus longirostris	Crevette rose
<i>Parapristipoma octolineatum</i>	African striped grunt	Grondeur rayé	Boca de oro					Parapristipoma octolineatum	
<i>Pecten jacobaeus</i>	Great Mediterranean scallop	Coquille Saint-Jacques de Méditerranée	Concha de peregrino	Coquille Saint-Jacques	Cappasanta			Pecten jacobaeus	Coquille Saint-Jacques
<i>Penaeus kerathurus</i>	Caramote prawn	Caramote	Langostino	Caramote	Mazzancolla			Penaeus kerathurus	Caramote

Scientific Name	English	French	Spanish	Algerian	Italian	Libyan	Maltese	Moroccan	Tunisian
<i>Phycis blennoides</i>	Greater forkbeard	Phycis de fond	Brotola de fango	Mostia kabirah	Musdea Bianca	Deeb	Lipp abjad	Bartola	Mostia kabirah
<i>Phyllonotus trunculus</i>	Banded murex	Murex tuberculé	Busano						
<i>Platichthys flesus</i>	Flounder	Flet	Platija	Flet	Passera	Samek mosa			Flet
<i>Plesionika edwardsii</i>	Striped soldier shrimp	Crevette Edward	Camarón soldado		Gobetto striato			Plesionika edwardsii	
<i>Plesionika martia</i>	Golden shrimp	Crevette dorée	Camarón marcial					Plesionika martia	
<i>Pleuronectes platessa</i>	Plaice	Plie	Solla		Passera	Samek mosa			
<i>Polyprion americanus</i>	Wreckfish	Cernier commun	Cherna	Cernier	Cernia di fondale	Farouj hotam	Dott or hanzir		Cernier
<i>Pomadasys incisus</i>	Bastard grunt	Grondeur métis	Roncador					Pomadasys incisus	
<i>Pomatomus saltatrix</i>	Bluefish	Tassergal	Anjova		Pesce serra	Magres	Serra tas-snien		Magres
<i>Prionace glauca</i>	Blue shark	Peau bleu	Tiburón azul	Bou menqar	Squalo azzurro	Zergaya	Huta kahla	Kalb labhar	Bou menqar
<i>Psetta maxima</i>	Turbot	Turbot	Rodaballo		Rombo chiodato		Barbun imperjali	Psetta maxima	
<i>Pseudaphya ferreri</i>	Ferrer's goby		Chanquete		Ghiozzetto pelagico				
<i>Raja africana</i>	African ray	Raie africaine	Raya Africana						
<i>Raja asterias</i>	Starry ray	Raie étoilée	Raya estrellada	Raie	Razza stellata	Mes'ha	Raja tal-kwiekeb		Raie
<i>Raja circularis</i>	Sandy ray	Raie circulaire	Raya falsa vela	Raie	Razza rotonda			Raja circularis	Raie
<i>Raja clavata</i>	Thornback ray	Raie bouclée	Raya de clavos	Raie	Razza chiodata	Mes'ha	Raja tal-fosos		Raie
<i>Raja fullonica</i>	Shagreen ray	Raie-chardon	Raya cardadora	Raie	Razza spinosa	Mes'ha	Raja petruza		Raie
<i>Raja miraletus</i>	Brown ray	Raie-miroir	Raya de espejos	Raie	Razza quattrochi	Mes'ha	Raja lixxa		Raie
<i>Raja naevus</i>	Cuckoo ray	Raie fleurie	Raya santiguesa		Razza fiorita	Mes'ha			
<i>Raja oxyrinchus</i>	Longnose skate	Pocheteau noir	Picón	Raie	Razza monaca	Mes'ha	Rebecchini		Raie
<i>Rhinobatos rhinobatos</i>	Common guitarfish	Poisson-guitare commun	Guitarra común	Poisson guitare	Pesce violino		Vjolin	Rhinobatos rhinobatos	Poisson guitare
<i>Ruditapes decussatus</i>	Grooved carpet shell	Palourde croisée d'Europe	Almeja fina	Palourde croisée					Palourde croisee
<i>Sarda sarda</i>	Atlantic bonito	Bonite à dos rayé	Bonito atlántico	Toumbrel	Cavaritu imperiali	Mghatat	Plantu	Cerda	Toumbrel
<i>Sardina pilchardus</i>	European pilchard	Sardine commune	Sardina	Sardina	Sardina	Sardin mabroum	Sardin kahla	Sardina	Sardina
<i>Sardinella aurita</i>	Round sardinella	Allache	Alacha	Latchah	Alaccia	Dardine	Lacca tal-faxx	Latcha	Latchah
<i>Sarpa salpa</i>	Salema	Saupe	Salema	Chelba	Salpa	Shilba	Xilpa	Hallama	Chelba
<i>Sciaena umbra</i>	Brown meagre	Corb commun	Corvallo		Corbo falso	Ghrab	Griebel		
<i>Scomber japonicus</i>	Chub mackerel	Maquereau espagnol	Estornino	Sqoumri	Lanzardo	Cawalli	Kavall	Kabaila	Sqoumri
<i>Scomber scombrus</i>	Atlantic mackerel	Maquereau commun	Caballa del Atlántico	Sqoumri	Macarello	Cawalli	Pizzintun	Kabaila	Sqoumri
<i>Scomberomorus commerson</i>	Narrow-barred Spanish mackerel	Thazard rayé	Carite estriado del Indo-Pacífico			Palamet yamani			
<i>Scophthalmus rhombus</i>	Brill	Barbue	Rémol	Turbot	Rombo liscio	Samek mosa	Barbun		Turbot
<i>Scorpaena elongata</i>	Slender rockfish	Rascasse rose	Gallineta rosada	Rascasse	Scorfano rosa		Slender rockfish	Scorpaena elongata	Rascasse
<i>Scorpaena notata</i>	Small red scorpionfish	Petite rascasse	Escorpora	Rascasse	Scorfanotto	shkorfo aswad	Skorfna tat-tebgha		Rascasse
<i>Scorpaena porcus</i>	Black scorpionfish	Rascasse brune	Rascacio	Rascasse	Scorfano nero	shkorfo aswad	Skorfna sewda		Rascasse

Scientific Name	English	French	Spanish	Algerian	Italian	Libyan	Maltese	Moroccan	Tunisian
<i>Scorpaena scrofa</i>	Red scorpionfish	Rascasse rouge	Cabralcho	Rascasse	Scarpina rossa	shkorfo	Cipullazza		Rascasse
<i>Scyliorhinus canicula</i>	Smallspotted catshark	Petite roussette	Pintarroja	Ktat	Gattuccio	Gtat	Gattarel	Gata	Ktat
<i>Scyllarides latus</i>	Mediterranean locust lobster	Grande cigale	Cigarra					Scyllarides latus	
<i>Sepia elegans</i>	Elegant cuttlefish	Seiche élégante	Choquito		Seppia elegante			Sepia elegans	
<i>Sepia officinalis</i>	Common cuttlefish	Seiche commune	Choco	Sepia	Seppia comune		Sicc	Sepia officinalis	Sepia
<i>Sepiola ligulata</i>	Tongue bobtail	Sépiole languette	Globito lenguita		Sepiolina			Sepiola ligulata	
<i>Sepiola rondeleti</i>	Rondelet's bobtail	Sépiole de Rondelet	Globito		Sepiolina			Sepiola rondeleti	
<i>Seriola dumerili</i>	Greater amberjack	Sériole couronnée	Pez de limón	Poisson limon	Ricciola	Sholah	Accola	Seriola	
<i>Serranus atricauda</i>	Blacktail comber	Serran à queue noire	Serrano imperial					Serranus atricauda	
<i>Serranus cabrilla</i>	Comber	Serran-chèvre	Cabrilla		Perchia	Serran	Sirrana		
<i>Serranus hepatus</i>	Brown comber	Serran-tambour	Merillo	Sarrano		Serran saghir			Sarrano
<i>Serranus scriba</i>	Painted comber	Serran-écriture	Serrano	Sarran	Sciarrano	Brakish	Brieqex		Sarran
<i>Siganus luridus</i>	Dusky spinefoot	Sigan somber	Sigano nebuloso			Batata			
<i>Solea laskaris</i>	Sand sole	Sole pole	Lenguado de arena	Sole	Sogliola nasuta			Solea laskaris	Sole
<i>Solea vulgaris</i>	Common sole	Sole commune	Lenguado	Sole	Sogliola	Mdas	Ingwata		Sole
<i>Solen marginatus</i>	Grooved razor shell	Couteau droit d'Europe	Longueirón						
<i>Sparisoma cretense</i>	Parrotfish	Perroquet-vieillard	Vieja colorada			Ghazla	Marzpan		
<i>Sparus aurata</i>	Gilthead seabream	Dorade royale	Dorada	Ourata	Orata	Kerraf	Awrata	Daurade	Ourata
<i>Sphyraena sphyraena</i>	European barracuda	Bécune européenne	Espetón	Brochet	Luccio marino	Mughzel shawish	Lizz		Brochet
<i>Spicara flexuosa</i>	Picarel	Gerle	Picarel	Gerle	Garizzo		Arznella tat-tikek	Spicara flexuosa	Gerle
<i>Spicara maena</i>	Blotched picarel	Mendole	Chucla	Tchoukla	Menula			Spicara maena	Tchoukla
<i>Spicara smaris</i>	Picarel	Picarel	Caramel	Tchoukla	Zerro	Retonno	Arznella		Tchoukla
<i>Spondylisoma cantharus</i>	Black seabream	Dorade grise	Chopa	Kannouta	Tanuta	Tannut	Tannuta	Dorade	Kannouta
<i>Squalus acanthias</i>	Picked dogfish	Aiguillat commun	Mielga	Kelb bahr	Spinarolo	Abushoka	Mazzola	Kalb	Kelb bahr
<i>Squatina squatina</i>	Angelshark	Ange de mer commun	Angelote	Sfinn	Squadro	Sfinn	Xkatlu	Ange de mer	Sfinn
<i>Squilla mantis</i>	Spottail mantis shrimp	Squille ocellée	Galera ocelada		Pannocchia			Squilla mantis	
<i>Symphodus rostratus</i>		Sublaire	Grivieta	Pitre	Subietto		Buxih ahdar	Syphodus rostratus	
<i>Symphodus tinca</i>	Peacock wrasse	Crénilabre paon	Peto	Demoiselle	Tordo Pavone			Syphodus tinca	Demoiselle
<i>Thalassoma pavo</i>	Ornate wrasse	Girelle paon	Fredi	Girelle paon	Donzella pavonina		Lhudi		Girelle paon
<i>Thunnus alalunga</i>	Albacore	Germon	Atún blanco	Għzel	Alalonga	Albacore	Alalonga	Germon	Għzel
<i>Thunnus thynnus</i>	Northern bluefin tuna	Thon rouge	Atún	Toun ahmar	Tonno	Tun	Tonn	Thone	Toun ahmar
<i>Torpedo torpedo</i>	Common torpedo	Torpille ocellée	Tremolina	Torpille	Torpedine ocellata		Haddiela ta' l'ghajnejn	Torpedo torpedo	Torpille
<i>Trachinotus ovatus</i>	Pompano	Palomine	Palometta blanca	Chèvre	Leccia stella	Azzabi	Strilja	Trachinotus ovatus	Chevre
<i>Trachinus draco</i>	Greater weever	Grand vive	Escorpion	Araignée	Tracina drago	Trajna	Sawt kbir		

Scientific Name	English	French	Spanish	Algerian	Italian	Libyan	Maltese	Moroccan	Tunisian
<i>Trachurus mediterraneus</i>	Mediterranean horse mackerel	Chinchard à queue jaune	Jurel mediterráneo	Chourou farasi	Suro	Saurou aswad	Sawrella	Chren	Chourou farasi
<i>Trachurus trachurus</i>	Atlantic horse mackerel	Chinchard d'Europe	Jurel	Chourou europi	Suro	Saurou	Sawrella kahla	Chrene	Chourou europi
<i>Trigla lucerna</i>	Tub gurnard	Grondin-perlon	Bejel	Galinette	Capone gallinella	Djaj	Gallinetta		Galinette
<i>Trigla lyra</i>	Piper gurnard	Grondin-lyre	Garneo	Galinette	Capone lira		Gallinetta	Trigla lyra	Galinette
<i>Trigloporus lastoviza</i>	Streaked gurnard	Grondin camard	Rubio	Galinette	Capone dalmato		Gallinetta tar-rigi	Trigloporus lastoviza	Galinette
<i>Trisopterus luscus</i>	Pouting	Tacaud commun	Faneca					Trisopterus luscus	
<i>Trisopterus minutus</i>	Poor cod	Capelan	Capellán		Merluzzetto			Trisopterus minutus	
<i>Umbrina canariensis</i>	Canary drum	Ombrine bronze	Verrugato de fango			unknown			
<i>Umbrina cirrosa</i>	Shi drum	Ombrine cotière	Verrugato fusco	Ombrine	Ombrina	Baghlah	Gurbell tad-daqna		Ombrine
<i>Umbrina ronchus</i>	Fusca drum	Ombrine fusca	Verrugato					Umbrina ronchus	
<i>Uranoscopus scaber</i>	Stargazer	Uranoscope	Miraciolo	Rascasse blanche	Pesce prete	Bollm	Zondu		Rascasse blanche
<i>Venerupis rhomboides</i>	Banded carpet shell	Palourde rose	Almeja rubia						
<i>Venus verrucosa</i>	Warty venus	Praire commune	Escupiña grabada	Praire commune					Praire commune
<i>Xiphias gladius</i>	Swordfish	Espadon	Pez espada	Bou sif	Pesce spada	Aboucet	Piscipat		Bou sif
<i>Xyrichthus novacula</i>	Pearly razorfish	Donzelle lame	Rao	Rason		Moshta			Rason
<i>Zeus faber</i>	John dory	Saint-Pierre	Pez de San Pedro	Saint-pierre	Pesce San Pietro	San bitro	Pixxi San Pietru		Saint-pierre

ÉTUDES ET REVUES DE LA CGPM DÉJÀ PUBLIÉES **GFCM STUDIES AND REVIEWS ALREADY ISSUED**

- 1 Standardisation de méthodes d'étude biométrique et d'observation de clupéidés (en particulier de *Sardina pilchardus*) utilisées en biologie des pêches. Division des pêches de la FAO. 1957
- 1 Standardization of biometric and observation methods for Clupeidae (especially *Sardina pilchardus*) used in fisheries biology. FAO Fisheries Division. 1957
- 2 Le Chalutage en Méditerranée – Observations préliminaires sur les chaluts italiens. Division des pêches de la FAO. Septembre 1957
- 2 Mediterranean trawling Preliminary observations in the study of Italian trawl nets. FAO Fisheries Division. September 1957
- 3 La pollution des eaux provoquée par les déversements des sucreries. Carlo Maldura et Paul Vivier. Avril 1958
- 3 Water pollution caused by wastes from sugar refineries. Carlo Maldura and Paul Vivier. April 1958
- 4 Filets tournants et coulissants en fibres synthétiques. Gerhard Klust. Septembre 1958
- 4 Ring nets made of synthetic fibres. Gerhard Klust. September 1958
- 5 La pisciculture dans les eaux intérieures des pays membres du CGPM. Secrétariat du CGPM. Février 1959
- 5 Inland water fisheries in the GFCM member countries. Secretariat of the GFCM. February 1959
- 6 Le chalutage en Méditerranée. Deuxième et troisième rapports. Division des pêches de la FAO. Mai 1959
- 6 Mediterranean trawling. Second and third reports. FAO Fisheries Division. May 1959
- 7 La technique des pêcheries dans les lagunes saumâtres. Ruggero de Angelis. Août 1959
- 7 Fishing installations in brackish lagoons. Ruggero de Angelis. August 1959
- 8 La situation de la pêche en Italie, en particulier dans le secteur de la distribution. Paolo Pagliazzi. Octobre 1959
- 8 Situation of the fishing industry in Italy, particularly regarding distribution. Paolo Pagliazzi. October 1959
- 9 Documentation graphique sur certains engins de pêche utilisés dans les lagunes littorales espagnoles. Fernando Lozano Cabo. Novembre 1959
- 9 Graphic documentation on some fishing gear used in Spanish coastal lagoons. Fernando Lozano Cabo. November 1959
- 10 Le chalutage en Méditerranée Quatrième rapport. J. Schärfe, Division des pêches de la FAO. Mars 1960
- 10 Mediterranean trawling. Fourth report. J. Schärfe, FAO Fisheries Division. March 1960
- 11 Le traitement du fond des étangs piscicoles et ses effets sur la productivité. La pisciculture dans divers pays européens. Alfred G. Wurtz. Juin 1960
- 11 Methods of treating the bottom of fish ponds and their effects on productivity. Fish culture in certain European countries. Alfred G. Wurtz. June 1960
- 12 Exploitation et description des lagunes saumâtres de la Méditerranée. Ruggero de Angelis. Août 1960

- 12 Mediterranean brackish water lagoons and their exploitation. Ruggero de Angelis. August 1960
- 13 Contrôle d'un chalut opérant entre deux eaux ou sur le fond et tiré par un seul bateau. J. Schärfe, Division des pêches de la FAO. Septembre 1960
- 13 A new method for "aimed" one-boat trawling in mid-water and on the bottom. J. Schärfe, FAO Fisheries Division. September 1960
- 14 Le chalutage en Méditerranée. Cinquième rapport. J. Schärfe, Division des pêches de la FAO. Mai 1961
- 14 Mediterranean trawling. Fifth report. J. Schärfe, FAO Fisheries Division . May 1961
- 15 La madrague sicilienne de course. Vito Fodera. Juillet 1961
- 15 The Sicilian tuna trap. Vito Fodera. July 1961
- 16 Influence de la température et de l'éclairement sur la distribution des crevettes des moyennes et grandes profondeurs. Walter Ghidalia et François Bourgois. August 1961
- 16 The influence of temperature and light on the distribution of shrimps in medium and great depths. Walter Ghidalia and François Bourgois. August 1961
- 17 L'amélioration des techniques de la pêche au feu. F. Bourgois et L. Farina, Experts de la FAO. Novembre 1961
- 17 Improvements of techniques for fishing with lights. F. Bourgois and L. Farina, FAO Experts. November 1961
- 18 L'élevage des huîtres en parcs flottants. M. Nikolic et I. Stojnic. Mars 1962
- 18 A system of oyster culture on floating shellfish parks. M. Nikolic and I. Stojnic. March 1962
- 19 Pêche au feu. Raimondo Sarà. Août 1962
- 19 Light fishing. Raimondo Sarà. August 1962
- 20 Réglementation en vigueur sur la pêche de la sardine en Méditerranée. Service d'études législatives de la FAO. Juillet 1963
- 20 Existing regulations for sardine fishing in the Mediterranean. FAO Legislation Research Branch. July 1963
- 21 Diagnoses démographiques sur les populations de poissons dans les cours d'eau à truites. R. Cuinat et R. Vibert. Octobre 1963
- 21 Demographic diagnosis on fish populations in trout streams. R. Cuinat and R. Vibert. October 1963
- 22 Dommages causés par les marsouins et autres animaux marins déprédateurs en Méditerranée. C. Ravel. Novembre 1963
- 22 Damage caused by porpoises and other other predatory marine animals in the Mediterranean. C. Ravel. November 1963
- 23 Etudes sur la sardine (*Sardina pilchardus* Walb.) et l'anchois (*Engraulis encrasicholus* L.) dans le golfe de Naples et sur leur comportement sous l'influence de la lumière artificielle. Olav Dragesund. Juin 1964
- 23 Studies on the sardine (*Sardina pilchardus* Walb.) and anchovy (*Engraulis encrasicholus* L.) in the Gulf of Naples and their behaviour in artificial light. Olav Dragesund. June 1964

- 24 Réglementations concernant certaines industries de transformation des produits des pêches maritimes dans les pays méditerranéens. D. Rémy. Septembre 1964
- 24 Regulations on certain sea food processing industries in Mediterranean countries. D. Rémy. September 1964
- 25 Sur la valeur des anneaux nets pour la détermination de l'âge des sardines (*Sardina pilchardus* Walb.). R. Muzinic. Décembre 1964
- 25 The value of sharp rings for the age determination of sardine (*Sardina pilchardus* Walb.,). R. Muzinic. December 1964
- 26 Revue critique des effets des détergents synthétiques sur la vie aquatique. R. Marchetti. Octobre 1965
- 26 Critical review of the effects of synthetic detergents on aquatic life. R. Marchetti. October 1965
- 27 Méthodes permettant d'économiser la main-d'oeuvre à bord des chalutiers méditerranéens. M. Ben-Yami. Novembre 1965
- 27 Labour-saving methods on board Mediterranean trawlers. M. Ben-Yami. November 1965
- 28 La distribution et la commercialisation du poisson en Sicile. G. Bombace. Novembre 1965
- 28 Preliminary report on fish distribution and marketing in Sicily. G. Bombace. November 1965
- 29 Réglementation sanitaire des mollusques. R. Coppini. Décembre 1965
- 29 Sanitary regulations for molluscs. R. Coppini. December 1965
- 30 L'élevage de la truite fario et de la truite arc-en-ciel dans les eaux à température très élevée. E.G. Calderon. Décembre 1965
- 30 The raising of brown trout and rainbow trout in water at high temperatures. E.G. Calderon. December 1965
- 30 (Suppl.1) Suite des études sur les possibilités de développement de la salmoniculture en eaux chaudes. E.G. Calderon. Novembre 1968

For years, the impoverishment of artisanal fishery in Mediterranean countries has been frequently reported at all levels when the urgency for intervention was systematically highlighted. In addition, it has also been reiterated that, at present, there is not enough knowledge either of the primary and secondary magnitudes of artisanal fishery or of the normative and managerial tools that cover the entire spectrum of competence. Information on artisanal fishery, in the wide sense, is fundamental for planning and management purposes. It is, therefore, extremely important to document all the elements that influence and interact directly or indirectly with artisanal fisheries (e.g. synergies, conflicts or friction, possible interaction and connection, etc.). During the project Cooperation Networks to Facilitate Coordination to Support Fisheries Management in the Western and Central Mediterranean (COPEMED), the first-ever inventory of regional artisanal fishery communities in the Central and Western Mediterranean was implemented. This was possible through direct assistance to some member countries to develop and improve their capacity to collect and analyse information on artisanal fisheries. The inventory resulted in a comprehensive list of all the fishing communities performing artisanal fisheries in the region, including their localization, description, use, pictures and other ancillary information. This exercise, based on 13 582 sites visited (interviewed), produced 11 papers, involved 16 scientists (regional and national), and also collected a selected bibliography of about 200 documents. Most of the results are presented in this paper.
