Mega-sporting Events as Experience Goods

Abstract: This paper tests the hypothesis that a nation's hosting of a mega-sporting event is an experience good for its residents. Applying data from an ex-ante and ex-post query based on contingent valuation methods, we use the Soccer World Cup 2006 as a natural experiment. The significant ex-post increase in valuation is shown to be due to adventitious citizens requiring an involving experience, rather than to an updating of a-prior assessment.

Keywords: Experience goods, contingent valuation method, World Cup

JEL classification: L83, Q26, H49

1 Introduction

Mega-sporting events like the Olympics, the Soccer World Cup (SWC) finals, or the Super Bowl attract the attention of a myriad of people, implying a variety of potential economic externalities. BAADE & DYE (1988), BAIM (1994), KANG & PERDUE (1994), TEIGLAND (1999), COATES & HUMPHREYS (1999; 2003), BAADE & MATHESON (2000; 2004), SZYMANSKI (2002), HOTCHKISS, MOORE, & ZOBAY (2003) test for positive pecuniary economic effects of sport events or sport stadiums. COATES & HUMPHREYS (2003) give a comprehensive survey of both economic impact studies assessing the pecuniary benefits and studies devoted to the non-pecuniary or "consumption" benefits to residents of the host countries.

Recently, another strand of literature emanated from cultural and environmental economics. It is concerned with the quantification of intangible economic ramifications of subsidized (public) goods such as the hosting of Major League teams, the Olympics, and the construction of stadiums in a city (EFTEC, 2005; JOHNSON, GROOTHUIS, & WHITEHEAD, 2001; JOHNSON & WHITEHEAD, 2000). This young body of literature adheres to the Contingent Valuation Method (CVM). It assesses

* Corresponding Author.

positive externalities that are not directly internalized by the market by quantifying the corresponding willingness-to-pay (*WTP*) of the concerned taxpayers (ARROW *et al.*, 1993).

To our knowledge the notion of experience goods – those for which consumers cannot assess use value in advance but only upon consumption or from past experience (NELSON, 1970; VAN DER PLOEG, 2002) – has not yet been empirically investigated in relation to CVM or sports, although VON UNGERN-STERNBERG & VON WEIZSÄCKER (1985, p. 534) suggested two decades ago that this be done.

Our study contributes to the literature in the following points. First, it offers an independent¹ and representative CVM-based quantification of the German population's *WTP* for hosting the 2006 SWC finals. Secondly, it unravels the nation's assessments of intangibles before *and* after the event.² Central determinants such as age and educational background are identified using censored regression models. Finally, our interpretation of the hosting of the SWC as an experience good opens a new perspective in the economic evaluation of mega-sporting events.

2 Data and Empirical Approach

Three months prior to and three months after the 2006 SWC finals in Germany, that is, in March and October, we conducted two online surveys. Our sample consists of 500 individuals.³ They are drawn from the *ComCult* Online Panel which is stratified by *TNS Emnid*, one of Germany's leading institutes in social science survey research. It is a representative sample for the German population aged 14 to 70.

¹ This does, for example, not apply to EFTEC (2005). For a critique of commissioned and frequently upward biased economic impact studies see COATES & HUMPHREYS (2003, p. 339).

² While BAADE & MATHESON (2004) is an example for a retrospective study, the EFTEC (2005) CVM analysis of the London 2012 Olympics clearly is of the ex-ante type.

³ Sixteen respondents of the ex-ante survey (3.2%) did not participate in the ex-post survey. We treat them as sticking to their ex-ante valuation. Notably, our results do not change qualitatively if we drop these individuals from the sample.

In the quarter prior to the start of the tournament the subjects were confronted with the following counterfactual scenario: *“Suppose that shortly before the beginning of the cup finals, severe doubts on security issues with regard to stadium construction and potential terrorist attacks are raised. Given the current status of security, the threat of terrorism is comparable in scale to that at the 1972 Olympics in Munich. Therefore, the FIFA is tending toward relocating the cup finals to Switzerland, where an ideal infrastructure is ready to stage the matches thanks to early and thorough preparation of the Swiss co-hosting of the 2008 European Cup finals. There is still a chance that the tournament will take place in Germany, but only if a series of costly safety measures are adopted. However, these previously unplanned measures can only be financed with immediate voluntary contributions from the population. Would you personally be willing to contribute some of your own money to ensure the finals can be hosted in your home country?”*

A quarter of a year after the Cup, the same persons were asked: *“About six months ago you were asked in a counterfactual scenario about your willingness-to-pay for your home country to host the SWC finals. Now that you experienced it, imagine yourself back in March: Would you change your mind and/or adjust the amount you would be willing to pay?”*

3 Findings and Estimates

Overall, we find that ex ante less than every fifth German has a positive *WTP*. However, after the event 42.6% of the population report a positive *WTP*. The corresponding increase is 129%. In sum, 26.6% of subjects changed their mind; 14.2% of these decreased their *WTP*, 85.5% increased it.

The average ex-ante *WTP* for the whole sample is €4.26 per person, which gives a total mean *WTP* of €351.5m for a total population of 82.5 million Germans. The average ex-ante *WTP* for individuals with a strictly positive *WTP* is €22.90. The average ex-post *WTP* for the whole sample is €10.07 per person, which gives a total mean *WTP* of €830.78m. The average ex-post *WTP* of test persons with a

$WTP > 0$ is €23.62. The average change in WTP is positive and amounts to €6.00. For the total population it is a substantial €495m.

Notably, there is a relatively small change of 72 cents in average WTP for the subsample of subjects with a $WTP > 0$. The substantial increase in overall WTP can be attributed to persons reporting a zero WTP ex ante and a positive ex-post WTP after experiencing the event. Who are these subjects?

Residents have an expected heterogeneous benefit from the national hosting (Table 1). They also face an individual shadow price of avoidable costs in case of relocation. This weighing-up against the reservation position depends on characteristics like age (AGE), educational level (EDU), gender ($MALE$), region ($BERLIN$, $EAST$), and employment status ($WORK$). If this propensity is correlated with the actual value (WTP), a selectivity problem arises. We use the two-step Heckit to test and account for it. The discrete choice decision is identified by AGE and $BENEFIT$. The latter is a dummy of whether a respondent sees an overall benefit for Germany or not. A corresponding question has been part of the survey.

Selectivity is only relevant for explaining the final WTP . It does not matter for the ex-ante WTP and the change in WTP . This suggests looking at the respective Tobit models that we censored left (0 for $WTP1$ and -70 for ΔWTP) and right (70) due to €70 being the upper WTP -threshold in our survey. While the educational level has a sizable, positive, and statistically significant impact on $WTP1$, it impacts negatively on ΔWTP , though to a lesser extent. This allows the interpretation that it was primarily the less educated who changed their WTP after the tournament. In the vast majority of cases, they did so from a zero value to a $WTP > 0$. However, this behavior is even more pronounced for residents of eastern Germany. A change in WTP is also positively dependent on whether an individual has a job or not ($WORK$). In nearly all specifications, age is negatively related to WTP and change in WTP .

In sum, we find two intriguing facts and evidence in favor of an experience goods character: First, the lion's share, i.e. 88%, of the ex-post increase in valuation of roughly €0.5bn can be attributed to adventitious contributors to the aggregate

WTP (with zero ex-ante *WTP*) rather than to a basic updating of the individual ex-ante *WTP*. Second, because it is relatively difficult to assess the intangibles involved in staging a mega-sporting event, residents with a lower educational level require experience for their valuation. The latter also holds for citizens from regions of the former GDR due to their lack of past experience.

4 Conclusion

This is a first test of whether mega-sporting events can be identified as experience goods for residents of the host country. According to our findings, CVM-studies – including studies from a cultural or environmental background – that ignore a potential experience good character might suffer from a downward-bias.
