## **PREPARATION OF THIS DOCUMENT**

This document is the final report of the FAO Regional Proposal Development Workshop “Assistance to Western Balkan Countries for Improving Compliance with International Standards for Aquatic Animal Health,” held in Zagreb, Croatia from 7–9 September 2009.

This activity is one part of the FAO Technical Cooperation Programme TCP/RER/3206 Assistance to Western Balkan Countries for Improving Compliance with International Standards on Aquatic Animal Health.

This report was prepared by Dr Melba B. Reantaso (Aquaculture Officer and also Lead Technical Officer of the TCP) and Dr J. Richard Arthur (FAO Consultant) with contributions from Dr Sanin Tanković and Dr Nihad Fejzić [FAO Consultants from the Technical Cooperation among Countries in Transition (TCCT)].

## **ACKNOWLEDGEMENTS**

Many thanks are due to the staff and officials of FAO Subregional Office for Central and Eastern Europe, the staff and officials of Croatia’s Ministry of Agriculture, Fisheries and Rural Development for various types of assistance in the organization of the workshop. The support of Mr Jiansan Jia and Dr Rohana Subasinghe of the Aquaculture Service (FIRA), Mr Agoston Egyhazy and Mr Thomas Moth-Poulsen (SEUM) of the FAO Subregional Office for Central and Eastern Europe, Mr Raimund Jehle and Mr Goran Stavrik (REUT) of the FAO Regional Office for Europe and Central Asia is also gratefully acknowledged. The kind assistance of Ms Marika Panzironi, Ms Marianne Guyonnet and Ms Tina Farmer of the Fisheries and Aquaculture Department is much appreciated.

FAO.

Report of FAO Regional Proposal Development Workshop “Assistance to Western Balkan Countries for Improving Compliance with International Standards for Aquatic Animal Health”. Zagreb, Croatia, 7–9 September 2009.

*FAO Fisheries and Aquaculture Report*. No. 969. Rome, FAO. 2011. 147p.

### **ABSTRACT**

The FAO Regional Proposal Development Workshop “Assistance to Western Balkan Countries for Improving Compliance with International Standards for Aquatic Animal Health” hosted by Croatia’s Ministry of Agriculture, Fisheries and Rural Development and held in Zagreb, Croatia from 7 to 9 September 2009, was participated by some 30 representatives from the veterinary authorities and other relevant organizations of the five participating Western Balkan countries (Bosnia and Herzegovina, Croatia, The former Yugoslav Republic of Macedonia, Monte Negro, and Serbia); and five representatives from the Food and Agriculture Organization of the United Nations (FAO) (including 1 international and 2 regional consultants).

Representatives of participating countries reviewed recent progress and priorities for national aquaculture development and aquatic animal health management in each country which paved the way for exchanging information and experiences concerning the status of aquatic animal health and programmes for disease diagnosis and prevention in the Western Balkan States.

A major outcome of this workshop was the development of a Regional Technical Cooperation Programme proposal “Assistance to Western Balkan countries for improving compliance to international standards for aquatic animal health”. The proposal was the result of a lengthy consultative and consensus-building process among countries of the Western Balkan Region which started in 2008 under two FAO projects (TCP/BiH 3101 and TCP/RER/3206). The proposal’s overall objective is to improve participating country compliance with international health standards for aquatic animals by addressing key areas identified by the regional needs assessment process so that countries are better able to maintain and improve national aquatic animal health status, harmonize standards regionally, and better comply with the health standard requirements of regional and international trading partners. The specific objectives of the project proposal are to: build regional aquatic animal health capacity; conduct a regional review and assessment of national legislation; design and implement a regional surveillance programme for aquatic animal diseases; and promote national, regional and international communication mechanisms and networking systems for aquaculture development. The development of the proposal was based on the following core principles: regional cooperation, team effort; transparency, and continuity.

## **BACKGROUND**

1. A Technical Cooperation Programme (TCP) of the Food and Agriculture Organization of the United Nations (FAO) – TCP/BiH/3101 project “Strengthening Capacity on Aquaculture Health Management” was officially approved on 14 June 2006 and had the development objective of increasing the effectiveness and efficiency of the State Veterinary Office of Bosnia and Herzegovina in aquatic animal health management. This objective supported sustainable and healthy aquaculture production that will enable the country to improve the value and efficiency of aquaculture production through the implementation of international animal health and food safety standards, especially those of its trading partners in Europe and neighbouring countries. One of the specific objectives of the above project was to disseminate the project outcomes to neighbouring trading partners in order to promote future cooperation in aquaculture and aquatic animal health management in the region. As part of the above TCP, the FAO Western Balkan Regional Seminar/Workshop on Aquatic Animal Health was undertaken from 19 to 21 May 2008 in Sarajevo, Bosnia and Herzegovina. This regional seminar/workshop represented the final regional activity of the TCP.

2. As an outcome of the above regional workshop, a TCP facility, TCP/RER/3206 Assistance to Western Balkan Countries for Improving Compliance with International Standards on Aquatic Animal Health, aimed at preparing a further regional proposal to FAO was approved in early 2009. The process of developing a regional TCP consists of the following activities: (i) a regional survey of aquatic animal health capacity and performance (May to August 2009) involving five countries in the Western Balkan region (i.e. Bosnia and Herzegovina, Croatia, The former Yugoslav Republic of Macedonia, Montenegro and Serbia), (ii) regional field assessment (May to August 2009), (iii) survey analysis and regional proposal preparation, and (iv) regional workshop.

3. This report presents the results of item (iv), the Regional Proposal Development Workshop “Assistance to Western Balkan Countries for Improving Compliance with International Standards for Aquatic Animal Health,” held in Zagreb, Croatia from 7–9 September 2009.

## **WORKSHOP PURPOSE, PARTICIPATION, PROCESS AND PRODUCTS**

4. The Workshop programme is presented as Appendix I and is briefly summarized below.

### **Purpose**

5. The objectives of the Regional Workshop were to: (1) present the outcomes of regional field assessment conducted from May to August 2009 involving the five Western Balkan countries; (2) present the analysis of the Western Balkan Regional Aquatic Animal Health Capacity and Performance Survey; (3) present recent developments in the aquaculture sector of each participating countries including priorities with respect to aquatic animal health management; (4) deliberate and build consensus on the essential components of the draft regional TCP proposal including implementation plan, time-line and responsibilities and (5) finalise the regional TCP proposal for submission to FAO and other interested donors.

### **Participation**

6. Some 30 representatives from the veterinary services and other relevant organizations of the five participating Western Balkan countries (Bosnia and Herzegovina, 4; Croatia, 15; The former Yugoslav Republic of Macedonia, 4; Montenegro, 4 and Serbia, 3); one representative from the European Union and five representatives from FAO (including one international and two regional consultants) participated in the workshop. A List of participants is given in Appendix II.

## Process

7. The workshop followed the general format of plenary presentations (opening presentations, outcomes of country field assessments, summary and analysis of the Regional Aquatic Animal Health Capacity Survey, five country aquaculture and aquatic animal health management reviews, and a draft Regional TCP Proposal). Group discussion and refinement of the draft proposal then followed and a revised draft proposal was presented and discussed. A proposed implementation plan, time-line and responsibilities were then presented, discussed and approved. A final presentation summarized the conclusions arising from the workshop and the way forward.

## Products

8. The products of the workshop include: (i) exchange of information and experiences concerning the status of aquatic animal health and programmes for disease diagnosis and prevention in the Western Balkan States, (ii) Report of the Western Balkans Regional Workshop (this report), which also contains two important documents, namely: (1) Western Balkans Regional Aquatic Animal Health Capacity and Performance Survey: Summary of Survey Results and Analysis (Appendix IV) and (2) a Regional TCP Proposal: *Assistance to Western Balkan Countries for Improving Compliance to International Standards on Aquatic Animal Health* (Appendix V).

## OPENING OF THE WORKSHOP

9. Opening remarks were provided by the Director and Chief Veterinary Officer (CVO) of Croatia's Ministry of Agriculture, Fisheries and Rural Development, Dr Sanja Šeparović; Fisheries and Aquaculture Officer of FAO Subregional Office for Central and Eastern Europe, Mr Thomas Moth-Poulsen; and the Director of the State Veterinary Office (SVO) and CVO of Bosnia and Herzegovina, Dr Drago N. Nedić. They welcomed the participants and wished everyone a productive and successful meeting and recognized the importance of aquaculture to the region and the need to focus efforts on sustainable aquaculture production through effective aquatic animal health management.

## WORKSHOP HIGHLIGHTS

13. The workshop had three sessions, namely: Session 1 with four presentations; Session 2 with six presentations; and Session 3 with two presentations and a wrap-up conclusion and the way forward. A list of presentations can be found in Annex III.

Outcomes of each session

### Session 1

13. Presentation 1 "*Introduction – backgrounder to project and workshop*" was delivered by FAO Aquaculture Officer and Lead Technical Officer of TCP/RER/3206, Dr Melba B. Reantaso, who stressed the need for regional cooperation on aquatic animal health management in the Western Balkans, and outlined the goals of the workshop (see paragraph 5). The presentation set the tone for the discussions to follow.

14. Presentation 2 "*Outcomes of field assessments in Serbia and Croatia*" was delivered by Dr Sanin Tanković, TCCT<sup>1</sup> Consultant. The overall objective of the field mission, conducted in May and August 2009, was to understand the field situation, to have the opportunity to meet face to face with the representatives of the relevant stakeholders, to collect the information concerning survey, to get

---

<sup>1</sup> Technical Cooperation among Countries in Transition

information on government priorities and interest with respect to aquatic animal health and generate support for a regional programme. During the mission in both countries, relevant competent authorities, veterinary institutes, and fish farms were visited. Both countries have supported the project, and concluded that aquaculture is becoming more and more important. It was also concluded that Croatia would host regional workshop, and all related activities in that sense, including preparation of prospectus, and appointment of the focal point. Furthermore, during the mission, minimum required data for the Terms of Reference for Focal Points have been agreed.

15. Dr Nihad Fejzić, TCCT Consultant, delivered Presentation 3 “*Outcomes of field assessments in Macedonia and Montenegro*”, conducted in September 2009 by him and Dr J. Richard Arthur. In both countries, veterinary authorities are the competent authorities on aquatic animal health and biosecurity of fish farms. A regional approach to managing aquatic animal health was supported by stakeholders met during the mission who also expressed interest in the following aspects: implementation of international and European Union (EU) legislation, appointment of national focal points, particular interest in transfer of knowledge, capacity building, improvement of diagnostic capacities, sharing of information and exchange of experiences, emphasis on the need for scientifically-based surveillance and the important role of aquaculture in agricultural production.

16. Dr J. Richard Arthur, FAO International Consultant, made the fourth presentation on “*An analysis and summary of the FAO Regional Aquatic Animal Health Capacity Survey Questionnaires in the Western Balkans*”. The purpose of the survey was to obtain information on national capacity and agencies implementing aquatic animal health programmes from the five participating countries, to collect essential information for support of the development of the aquaculture sector, and to discuss components and activities that might be included in the regional TCP project. The survey questionnaires, based on a previous FAO aquatic animal health capacity surveys done for the Middle East and the South African regions, consist of 17 different sections, as follows: (1) international trade in live aquatic animals and national border controls, (2) control of domestic movement of live aquatic animals and other domestic activities that can spread the pathogens, (3) policy and planning, (4) legislation, (5) disease surveillance, (6) disease diagnostic, (7) emergency preparedness and contingency planning, (8) extension services, (9) compliance, (10) research, (11) training, (12) expertise, (13) infrastructure, (14) linkages and cooperation, (15) funding support, (16) current challenges and constraints and (17) aquaculture trends, resources and production data. The full analysis and summary can be found in Appendix IV.

## **Session 2**

17. During Session 2, country presentations prepared by representatives of the veterinary authorities of five Western Balkan regional countries (Albania, Croatia, Montenegro, The former Yugoslav Republic of Macedonia, Serbia) reviewed the recent developments and priorities for national aquaculture development and aquatic animal health management in each country. The last presentation under Session 2 was about the Regional TCP proposal “Assistance to Western Balkan Countries for Improving Compliance to International Standards on Aquatic Animal Health.

18. Dr Almedina Zuko, in her presentation on “*Recent developments and priorities on aquaculture and aquatic health management in Bosnia and Herzegovina*”, described the historical development of the aquaculture in the country, including basic information on hydrography and ichthyofauna, and the aquaculture profile in terms of production, species and export capacities. Bosnia and Herzegovina has a long history of aquaculture production. Since 1886 up to present, the country has seen both progress and stagnation (due to war) in aquaculture development. Serious development started again in 2004, when the Council of Ministries of Bosnia and Herzegovina recognized possibilities in aquaculture development and gave full power to the SVO of Bosnia and Herzegovina in organizing veterinary service in aquaculture. The hydrological resources of the country belong to the river basin of the Black and Adriatic Sea with 20 000 km of rivers and brooks, 400 hectares of lakes

and 1 400 hectares of seacoast. The main cultured species are salmonid species (rainbow trout, brown trout, brook char, grayling) with current production of 3 500 tonnes; cyprinid species (common carp, silver carp, sheat fish, zander), with current production of 3 000 tonnes; and marine fish species (European seabass, gilt-head seabream, dentex, Mediterranean mussel, oyster), with 200 tonnes production capacity. The presentation also covered activities of the National Reference Laboratory for viral fish diseases, including data on disease surveillance, presence of certain fish diseases in the country, diagnostic methods in use, training of the laboratory staff, collaboration with the other laboratories and with the EU Community Reference Laboratory, implemented project activities, and targeted surveillance results. While the country has the advantage of having high quality and clean water, cheap and educated employees, strong capability to establish factories for fish processing, and good hatcheries, there are a number of weaknesses. These include low domestic fish consumption, lack of domestic production in fish feed, limited purchasing power of consumers, weak road infrastructure, uncoordinated market, and low subsidies. Bosnia and Herzegovina has achieved export of fishery products to the EU market, with four establishments obtaining EU export license number. The presentation concluded with a list of activities identified as needed in the future; these include: complete harmonization with the EU legislation, accreditation and equipping of laboratories, uniform registration of all fish farms, continuing monitoring of fish diseases, residues and other contaminants.

19. The presentation by Dr Ivica Sućec on “*Recent developments and priorities on aquaculture and aquatic health management in Croatia*” introduced the organization of veterinary service in Croatia, the legislative framework on aquatic animal health, and future activities. Aquatic animal health surveillance is conducted on all fish and mollusc farms, as well as the open waters. Planned future activities include implementation of EU legislation, zoning, development of annual inspection plans, emergency preparedness and awareness. The presentation also described issues related to the establishment, development and operations of the National Reference Laboratory, including data and results of the obligatory surveillance, and most often encountered diseases. The following were presented as priorities: development of management model focused on preventive measures and diagnostic procedures taking into the consideration epidemiological situation in trading partner countries; current epidemiological situation in the close vicinity is considered as very unfavorable for Croatian aquaculture; unknown health status of neighboring countries; main concern for carp culture taking into consideration heavy losses due to koi herpesvirus (KHV) in other countries; establishment of the regional network for immediate exchange of information; and assistance in diagnostic work.

20. Dr Olivera Kamaranova, in her presentation on “*Recent developments and priorities on aquaculture and aquatic health management in The former Yugoslav Republic of Macedonia*” gave an overview of the veterinary service in The former Yugoslav Republic of Macedonia, legislative framework in aquatic animal health, responsibilities concerning aquatic animal health and safety, import of aquaculture and import risk management measures, as well as the information on aquatic animal health surveillance. The presentation included disease data based on surveillance, current aquaculture capacities and production, crucial factors for international trade with live aquatic animals, including membership in the World Organisation for Animal Health (OIE) and the World Trade Organization (WTO), and policy and planning issues regarding national aquatic animal health. Current priorities regarding national aquaculture policy include improvement of export management, development of modern aquaculture production through increasing the number of fish farms and production; and improvement of aquatic biosecurity management in aquaculture.

21. Dr Tatjana Babović, in her presentation on “*Recent developments and priorities on aquaculture and aquatic health management in Montenegro*” noted the importance of the fishery sector to the economy of the country, with almost 630 persons employed in the sector. The share of fisheries sector in the national gross domestic product is 0.5 percent and 3.1 percent of the gross product of the agricultural sector. About 3 000 tonnes of fish are produced from both capture fisheries and aquaculture. These consisted of 2 300 tonnes from capture fisheries (1 700 tonnes seafish, 600 tonnes of freshwater fish) and about 700 tonnes from trout and marine fish (sea bream, sea bass and shellfish) farming. Freshwater fish catch comes mainly from the Skadar Lake, predominantly carp.

There are 24 freshwater farms, 2 marine fish farms, 16 shellfish farms, 2 facilities for fish processing, and 3 facilities for export of marine fish caught in EU countries. Priorities of the aquaculture strategy of Montenegro focus on strengthening the competitiveness of the fish processing industry, creating a favourable environment for investment in the fisheries sector and the domestic fishing fleet renewal, improving facilities, well as to support the safety of fishery products through the introduction of necessary changes in national legislation in the field of food safety and improvement of laboratories dealing with chemical and microbiological analysis. Additional future priorities for aquaculture in Montenegro include harmonizing EU legislation with national legislation, strengthening of administrative capacities, human resource development, standardization of laboratory procedures, drafting of guidelines/manuals/technical materials and improving cooperation at all administrative levels.

22. Dr Nebojša Jovanović, in his presentation on “*Recent developments and priorities on aquaculture and aquatic health management in Serbia*” reported on the historical development and facts concerning aquaculture sector in the country, and presented the outcomes of a SWOT<sup>2</sup> analysis for the aquaculture sector. Information on water resources, aquaculture production, organization of competent authorities and legislative framework on aquatic animal health were presented. The presentation also described project- and research-related activities and their implementation, development and operations of national laboratory, including data and results of the diagnostic tests of aquatic animals.

23. Dr J. Richard Arthur, FAO International Consultant, presented a draft Regional TCP Proposal “*Assistance to Western Balkan Countries for Improving Compliance to International Standards on Aquatic Animal Health*”, developed by the FAO Project Team. The overall objective of the proposal was to improve compliance of participating countries to international standards on aquatic animal health. The proposal had four specific objectives: (1) capacity building of regional competent authorities; (2) review of national legislation and its harmonization with relevant international standards; (3) establishment of regional surveillance programme; and (4) promotion of communication mechanisms and networking system for aquaculture development. Implementation of the project will be achieved through five technical workshops on the following subject areas such as risk analysis; surveillance, monitoring and reporting; diagnostics; legislation; and aquaculture development and promotion. Project implementation will be handled by a Regional Project Coordinator, five Country Focal Points and to be supported by regional experts, international consultants and FAO backstopping officers.

### Session 3

24. Two presentations were delivered and a wrap-up Conclusion and the Way Forward served as the final input to the workshop.

25. Dr J. Richard Arthur, presented the final draft of the Regional TCP proposal. Following additional discussion, the revised proposal was accepted by the five participating countries. The major components of the proposal are as follows:

Overall Objective: To improve participating country compliance with international health standards for aquatic animals.

- Four specific objectives:
  - build capacity on specific themes (legislation, risk analysis, surveillance (aquatic epidemiology), diagnostics, emergency preparedness/contingency planning, aquaculture development and promotion);
  - review of national legislation to harmonize with respect to compliance with international standards on aquatic animal health (WTO-SPS, OIE, EU);

---

<sup>2</sup> strengths, weaknesses, opportunities and threats.

- design a regional disease surveillance programme for aquatic animal diseases (regional in scope, e.g. five Western Balkan countries, surveillance design based on international standards);
- promote communication mechanisms and networking systems for aquaculture development.
- Working principles:
  - regional cooperation; national interest to benefit from such mechanism;
  - team effort: every activity will be jointly lead by a team (FAO, Regional Project Coordinator, Focal Point, Regional/International Experts), regional participants and other interested partners (e.g. OIE, EU, donors);
  - transparency: using a communication portal – Western Balkan Aquatic Animal Health website (project-based): English and regional language;
  - continuity and forming a core group of AAH: 4 participants from each country; 2 of which will be participating in all activities;
  - 4-month interval for preparatory work and implementation of activities;
  - publication outputs in English;
  - workshops with simultaneous translation.
- Expected outputs:
  - improved national and regional capacity;
  - core group of AAH;
  - wide range of publications (training/workshop/meeting reports, diagnostic manual, surveillance design, emergency/contingency plan, aquaculture profile, promotional materials, national/regional strategy)
  - portal of communication (website);
  - high level political will/commitment;
- Proposed sponsorships of regional training/workshops:
  - legislation/risk analysis – Croatia;
  - surveillance – Serbia;
  - diagnostics – Bosnia and Herzegovina;
  - emergency preparedness/ contingency planning – The former Yugoslav Republic of Macedonia;
  - aquaculture promotion/strategy – Montenegro;
  - high level meeting/Project terminal workshop – Bosnia and Hertzegovina;

26. On behalf of the Project team, Dr. Nihad Fejzić, then presented a proposed workplan, time-frame and responsibilities for further development and submission of the final proposal to FAO. The workplan, and responsibilities were then discussed in detail by the participants and following discussion and revisions, consensus, on the structure and contents, reached among the five participating countries.

27. The Workshop concluded with a plenary presentation by Dr Melba Reantaso which summarized the results of the workshop and presented the steps that would need to be taken to finalize project activities and the submission of the final regional proposal to FAO for funding consideration.

The main conclusions included the following:

- active participation and strong interest and support in the development of the proposal;
- strong support (4/5 CVOs, competent authorities, laboratories, research institutes and universities);
- systematic, logical and transparent process (two regional workshops, regional survey, country level field assessment/stakeholder consultation);

- strong consensus on the scope and elements of regional proposal through regional cooperation.

28. The Way Forward included the following: publication of workshop report which will contain workshop highlights, the analysis of the survey and a complete Regional TCP proposal.

#### **CLOSING OF THE WORKSHOP**

29. The workshop organizers, FAO and Croatia's Ministry of Agriculture, Fisheries and Rural Development, thanked all the delegates for their fruitful contributions which made the workshop a successful event. The participants thanked FAO for a well organized meeting and the local host for the hospitality.

## APPENDIX I

## Workshop Programme

<b>7 September 2009 (Monday)</b>	Arrival of participants
20.00	Welcome dinner
<b>8 September 2009 (Tuesday)</b>	
08.30–09.00	Registration
09.00–09.30	<b>Opening Session</b>
	Opening and welcome remarks: Dr Sanja Šeparović (Chief Veterinary Officer of Croatia) Dr Thomas Moth-Poulsen (FAO Subregional Office for Central and Eastern Europe) Dr Drago Nedić (Chief Veterinary Officer of Bosnia and Herzegovina)
09.30–09.45	Self-introduction of participants
	<b>Session 1</b>
09.45–10.00	Presentation 1 Introduction – Backgrounder to project and workshop (Dr Melba B. Reantaso, FAO)
10.00–10.30	Coffee break
10.30–10.50	Presentation 2 Outcomes of field assessments in Serbia and Croatia (Dr Sanin Tanković, FAO)
10.50–11.10	Presentation 3. Outcomes of field assessments in The former Yugoslav Republic of Macedonia and Montenegro (Dr Nihad Fejzić, FAO)
11.10–11.40	Presentation 4. Analysis of the Survey Questionnaire on Aquatic Animal Health Performance and Capacity in Western Balkan States (Dr J. Richard Arthur, FAO)
11.40–12.20	Discussion
12.10–13.30	Lunch break
	<b>Session 2</b>
13.30–13.45	Presentation 5 Recent developments and priorities on aquaculture and aquatic health management in Bosnia and Herzegovina (Dr AlmedinaZuko)
13.45–14.00	Presentation 6 Recent developments and priorities on aquaculture and aquatic health management in Croatia (Dr Ivica Sucec)
14.00–14.15	Presentation 7 Recent developments and priorities on aquaculture and aquatic health management in The former Yugoslav Republic of Macedonia (Dr Olivera Karamanova)

14.15–14.30	Presentation 8 Recent developments and priorities on aquaculture and aquatic health management in Montenegro (Dr Tatjana Babović)
14.30–14.45	Presentation 9 Recent developments and priorities on aquaculture and aquatic health management in Serbia (Dr Nebojša Jovanović)
14.45–15.30	Presentation 10 Regional Technical Cooperation Programme Proposal: Assistance to Western Balkan Countries for Improving Compliance to International Standards on Aquatic Animal Health (Dr J. Richard Arthur, FAO)
15.30–16.00	Coffee break
16.00–17.30	Discussion
19.30	Dinner
<b>9 September 2009 (Wednesday)</b>	<b>Session 3</b>
08.30–09.30	Presentation 11 Final draft of Regional TCP Proposal (and discussion) (Dr J. Richard Arthur, FAO)
09.30–10.30	Presentation 12 Implementation plan, time-line and responsibilities (and discussion) (Dr Nihad Fejzić, FAO)
10.30–11.00	Coffee break
11.00–12.00	Conclusion and Way Forward (Dr Melba Reantaso, FAO)
12.00–14.00	Lunch break
14.00	Departure of participants

Annex I	Questionnaire survey form
Annex II	List of persons completing the survey questionnaire
Annex III	Identification of competent authorities for various aspects of aquatic animal health
Annex IV	List of publications related to aquatic animal health in The former Yugoslav Republic of Macedonia

## BACKGROUND

This regional survey of aquatic animal health capacity and performance was recommended by the recent Western Balkan Regional Seminar on Aquatic Animal Health, an activity under the FAO/TCP/3101/BiH “Strengthening Capacity on Aquaculture Health Management in Bosnia and Herzegovina” held from 19 to 22 May 2008 in Sarajevo and was strongly supported by representatives of the following participating countries [Bosnia and Herzegovina (BiH), Croatia, The former Yugoslav Republic of Macedonia, Montenegro and Serbia]. It is one of a series of activities being conducted under a TCP Facility from the FAO (TCP/RER/3206) entitled “Assistance to Western Balkans Countries for Improving Compliance with International Standards for Aquatic Animal Health,” an initiative that is expected to lead to the development of a proposal for an FAO Regional TCP Project “Assistance to Western Balkan Countries for Improving Compliance to International Standards on Aquatic Animal Health”.

The regional survey provides background information for assessment of the current status and future needs in aquatic animal health capacity and expertise of countries in the Western Balkans Region that will assist in formulating a proposal for an FAO Regional TCP Project. The activities conducted under the TCP Facility support included the following: (i) assessment of institutional and human resource capacities on aquatic animal health at national level through a questionnaire survey, (ii) follow-up field visits to verify survey results and collect additional key data, (iii) preparation of a proposal for a Regional TCP Project and (iv) organization of a regional workshop to present the results of the survey, and further develop and achieve consensus on the regional TCP project proposal.

## PURPOSE

The seven countries comprising the Western Balkans (Albania and the newly independent nations of the former Yugoslavia – Bosnia and Herzegovina, Croatia, The former Yugoslav Republic of Macedonia, Montenegro, Serbia and Slovenia) have a long history of aquaculture. These countries are in the process of developing modern aquaculture production systems as a means of providing healthy low-cost protein to their citizens and generating export earnings. The region has an advantageous situation with regard to aquaculture development, having large areas of high-quality fresh waters, skilled and relatively inexpensive labour, and proximity to large markets in the European Union (EU).

To realize this potential, Western Balkan countries are attempting to develop the capacity to meet international standards for trade in live aquatic animals (fish, crustaceans and molluscs) and their products. Primary among these are the standards of the World Organisation for Animal Health (formerly the Office International des Epizooties, OIE) as expressed in the OIE *Aquatic Animal Health Code* and *the Manual for Diagnosis of Aquatic Animal Diseases*, the Sanitary and Phytosanitary Agreement (SPS Agreement) of the World Trade Organization (WTO), and the standards for market access as required by the EU, as expressed in various EU Directives. Achieving these goals requires meeting high standards for aquaculture production, including a high level of capacity to address issues related to the control and prevention of aquatic animal diseases.

The purpose of this survey was to obtain information on national capacity and the agencies mandated to implement aquatic animal health programmes for five Western Balkans regional countries (Bosnia and Herzegovina, Croatia, The former Yugoslav Republic of Macedonia, Montenegro and Serbia). The survey also collected relevant information essential to support the development of the aquaculture sector through healthy aquatic production and sought opinions on the components and activities that might be included in a regional aquatic animal health strategy. The results of this survey will help guide regional and national strategic planning for improving aquatic animal health and assuring adequate and rational support services to achieve sustainable aquaculture development.

## **SURVEY STRUCTURE AND PROCESS**

The scope of the survey and the associated survey form<sup>1</sup> were jointly developed by the Food and Agriculture Organization of the United Nations (FAO), Fisheries and Aquaculture Department, Aquaculture Service (FIRA), Aquaculture Officer (M.B. Reantaso), the FAO International Consultant (J.R. Arthur) and the FAO TCCT<sup>2</sup> Consultants (S. Tanković and N. Fejić). The finalized survey questionnaire was sent by e-mail to the Competent Authorities (CA) of the five participating countries with instructions that it should be completed by the national CA or other senior government officer with primary responsibility for national aquatic animal health issues, with the assistance of national aquaculture experts and concerned laboratory personnel. The completed surveys were to be returned to FAO by early June (in the case of BiH, Croatia and Serbia) or the end of August 2009 (in the case of The former Yugoslav Republic of Macedonia and Montenegro), so as to be available for discussion during field visits by the two FAO consultancy teams (M.B. Reantaso and S. Tanković to Croatia and Serbia during 24 May to 7 June 2009, and J.R. Arthur and N. Fejić to The former Yugoslav Republic of Macedonia and Montenegro from 25 August to 2 September 2009). Using the completed survey returns, the FAO's International Consultant was to prepare a document summarizing the results of the survey returns and containing an analysis of the results. The summary and analysis of survey returns, as well as an outline for a regional programme based on the survey and other relevant sources of information, were then presented during the Regional Proposal Development Workshop "Assistance to Western Balkan Countries for Improving Compliance with International Standards for Aquatic Animal Health", held in Zagreb, Croatia from 7 to 9 September 2009. The initial draft document served as a basis for discussion and further elaboration of a regional aquatic animal health development programme, including recommendations for implementation, during a brainstorming exercise that was undertaken during the regional workshop.

The survey questionnaire contains 17 sections pertaining to: (1) international trade in live aquatic animals and national border controls, (2) control of domestic movement of live aquatic animals and other domestic activities that may spread pathogens, (3) policy and planning, (4) legislation, (5) disease surveillance/monitoring, (6) disease diagnostics, (7) emergency preparedness/contingency planning, (8) extension services, (9) compliance/enforcement, (10) research, (11) training, (12) expertise, (13) infrastructure, (14) linkages and cooperation, (15) funding support, (16) current challenges, and constraints and (17) additional information (a blank Survey Questionnaire is appended as Annex I).

## **PREPARATION OF THE SURVEY SUMMARY AND ANALYSIS**

Survey forms were returned by the focal points of all five participating countries. A list of people completing the Survey Questionnaire is given as Annex II. Checking of forms for completeness and collation of data were carried out by the International and TCCT Consultants. During compilation of the survey results, missing or incomplete data for some questions were encountered and responses occasionally required further clarification. Thus all respondents were again contacted and requested to provide further specific information, as needed.

The results of the survey are presented in this document in tabular form, the sequence of presentation of information following the sequence of Sections and Questions used in the Western Balkans Regional Aquatic Animal Health Capacity and Performance Survey form (see Annex I). During preparation of this summary, responses have been edited for English language and to reduce length; however, all significant information provided in the original survey forms has been retained. For each of the 17 Sections of the Survey Questionnaire, a written **Summary of results** detailing important

---

<sup>1</sup> The original concept of developing a survey questionnaire to assess aquatic animal health capacity and performance stemmed from an aquatic biosecurity capacity building project implemented by FAO for southern African countries between 2008–2009, as support to the development of a regional aquatic biosecurity framework for southern Africa. The original survey questionnaire was jointly developed by FAO Consultant Dr Ramesh Perera and FAO Aquaculture Service Officers, Drs Rohana P. Subasinghe and Melba Reantaso.

<sup>2</sup> Technical Cooperation among Countries in Transition.

features of the results is presented, which is followed by a brief **Analysis** of the significance of the results with regard to current and future development of aquatic animal health capacity in the Western Balkan region. Original survey forms as completed by the respondents for each country are retained by FAO.

Results of the survey questionnaire, summarized in tabular form, are cross-referenced to the original survey questionnaires, with each table caption providing a reference to the sections of the questionnaire covered by that table. Additionally, where relevant, individual table column headings are accompanied by numbers (given in parentheses) indicating the precise question for which results are summarized.

The following abbreviations are used throughout the summary tables:

- AAH = aquatic animal health
- AAC = aquatic animal commodities
- BiH = Bosnia and Herzegovina
- HC = health certificate
- NA = Not applicable (question or portion of question was not applicable to the country situation)
- NR = No response (Respondent did not reply to question)
- OG = Official Gazette

## SECTION 1. INTERNATIONAL TRADE IN LIVE AQUATIC ANIMALS AND NATIONAL BORDER CONTROLS

### A. *Relevant international memberships*

#### Summary of results

Table 1A summarizes the status of participating countries with regard to membership in the World Organisation for Animal Health (OIE), the World Trade Organization (WTO) and the European Union (EU) (Survey Questionnaire Parts 1.1–1.7). All five participating countries are members of the OIE, while two countries (Croatia and The former Yugoslav Republic of Macedonia) are members of the WTO. No participating countries are members of the EU, although Croatia and The former Yugoslav Republic of Macedonia are official candidate countries and BiH, Montenegro and Serbia are official potential candidate countries. BiH, Croatia and Montenegro are approved to export certain aquatic animal commodities to the EU.

#### Analysis

Membership of countries in international bodies such as the OIE, WTO, EU, etc. requires that countries abide with the conditions of membership, thus placing obligations upon the Competent Authorities in terms of implementation and compliance with the provisions embodied in those agreements and memberships.

The World Organisation for Animal Health (<http://www.oie.int>), created in 1924 as the Office International des Épizooties (OIE), is the intergovernmental organization responsible for improving animal health worldwide. As of April 2009, the OIE had a total of 174 Member Countries and Territories. The OIE maintains permanent relations with 36 other international and regional organizations and has Regional and Sub-regional Offices on every continent. Worldwide aquatic animal health is protected and maintained through its *Aquatic Animal Health Code* (the “Code”), and *Manual of Diagnostic Tests for Aquatic Animals* (the “Manual”, available at: [http://www.oie.int/eng/normes/fmanual/A\\_summry.htm?e1d11](http://www.oie.int/eng/normes/fmanual/A_summry.htm?e1d11)). The OIE Aquatic Animal Health Standards Commission prepares these standards with assistance of internationally renowned experts and also oversees OIE’s activities on aquatic animal health ([http://www.oie.int/aac/eng/en\\_fdc.htm](http://www.oie.int/aac/eng/en_fdc.htm)).

One of the main objectives of the OIE, within its mandate under the World Trade Organization’s *Agreement on the Application of Sanitary and Phytosanitary Measures* (SPS Agreement) is to safeguard the world trade by publishing health standards for international trade in animals and animal products. OIE’s main normative work on aquatic animals is articulated through the Code and Manual, which provide a range of tools that assist OIE member countries in preventing and controlling aquatic animal diseases. OIE’s programme is based on a broad combination of activities, including listing of serious diseases of international importance; disease surveillance, monitoring and reporting; contingency planning; disease zoning; standardized diagnostics testing; use of international health certificates; risk analysis; designation and evaluation of Competent Authorities; etc.

As OIE members, all participating countries are obligated to apply the various standards and procedures as outlined in the Code and Manual. In addition to other monthly and annual reporting responsibilities to the OIE, the National Veterinary Services of OIE member countries are obligated to immediately report (within 24 hours):

- for OIE-listed DISEASES, (i) the first occurrence or re-occurrence of a disease in a country or ZONE or COMPARTMENT of the country, if the country or ZONE or COMPARTMENT of the country was previously considered to be free of that particular DISEASE; or (ii) if the DISEASE has occurred in a new host species; or (iii) if the DISEASE has occurred with a new pathogen strain or in a new DISEASE manifestation; or (iv) if the DISEASE has a newly recognized zoonotic potential; and
- for DISEASES not listed by the OIE, if there is a case of an EMERGING DISEASE or pathogenic agent should there be findings that are of epidemiological significance to other countries.

The World Trade Organization (WTO) (<http://www.wto.org/>) is an international organization with headquarters in Geneva, Switzerland, designed to supervise and liberalize international trade. The WTO was established on 1 January 1995 and is the successor to the General Agreement on Tariffs and Trade (GATT). The WTO deals with the rules of trade between nations at a near-global level. It is responsible for negotiating and implementing new trade agreements and is in charge of policing member countries' adherence to all WTO agreements.

The WTO is concerned with aquatic animal health to the extent that the occurrence of aquatic animal diseases may be used to restrict trade in aquatic animals and their products between WTO member countries. Rules for the application of sanitary measures to protect member countries from serious diseases that may be spread via international trade are outlined under the *Agreement on Sanitary and Phytosanitary Measures*<sup>3</sup>. The WTO has recognized the OIE as the reference organization for aquatic animal health issues. In general, sanitary measures above those specified in the OIE Code must be justified by risk analysis.

The European Union (EU) is an economic and political union of 27 member states, located primarily in Europe (<http://europa.eu/>; [http://en.wikipedia.org/wiki/European\\_Union](http://en.wikipedia.org/wiki/European_Union)).<sup>4</sup> Committed to regional integration, the EU was established by the Treaty of Maastricht on 1 November 1993 upon the foundations of the pre-existing European Economic Community. With almost 500 million citizens, the EU generates an estimated 30 percent (US\$18.4 trillion in 2008) of the nominal gross world product. The EU has developed a single market through a standardized system of laws that apply in all member states, ensuring the freedom of movement of people, goods, services and capital. It maintains common policies on trade, agriculture, fisheries and regional development. A common currency (the euro) has been adopted by 16 member states that are thus known as the Eurozone. The EU has developed a limited role in foreign policy, having representation at the WTO, G8 summits and at the United Nations (UN). It enacts legislation in justice and home affairs, including the abolition of passport controls between many member States.

The EU operates through a hybrid system of supranationalism (e.g. majority voting and directly applicable laws) and intergovernmentalism (e.g. consensus bargaining by states). Important institutions and bodies of the EU include the European Commission, the Council of the European Union, the European Council, the European Court of Justice and the European Central Bank. The European Parliament is elected every five years by member states' citizens, to whom the citizenship of the EU is guaranteed.

To join the EU, a country must meet the Copenhagen criteria, defined at the 1993 Copenhagen European Council. These require a stable democracy that respects human rights and the rule of law; a functioning market economy capable of competition within the EU; and the acceptance of the obligations of membership, including EU law. Evaluation of a country's fulfillment of the criteria is the responsibility of the European Council.

The membership of all five participating countries in the OIE and of two of the five countries in the WTO provides participating countries with a common, agreed-upon formal methodology and structure (as outlined in the OIE Code and Manual) for conducting trade in live aquatic animals and which can

<sup>3</sup> The SPS Agreement, available at: [http://www.wto.org/english/docs\\_e/legal\\_e/15-sps.pdf](http://www.wto.org/english/docs_e/legal_e/15-sps.pdf)

<sup>4</sup> Members of the EU include: Austria, Belgium, Bulgaria, Cyprus, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden and the United Kingdom. Three countries are official candidate countries (Croatia, The former Yugoslav Republic of Macedonia and Turkey) and five others are officially recognized as potential candidates (Albania, Bosnia and Herzegovina, Montenegro, Serbia and Iceland). Kosovo is also listed as a potential candidate but the European Commission does not list it as an independent country because not all member States recognize it as an independent country separate from Serbia.

be used in developing national and regional aquatic animal health programmes. Additionally, the actions initiated by all participating countries to access EU markets for aquatic animal commodities and to eventually achieve EU membership requires improvements in many areas of national aquatic animal health policy, capacity and management so as to be able to meet EU standards.

**Table 1A. Relevant international memberships (Questionnaire Parts 1.1–1.7)**

Country	(1.1) OIE member	(1.2) OIE official delegate	(1.3) WTO member	(1.4) EU member	(1.5) Status of EU application	(1.6) Approved to export aquatic animal commodities to EU? <sup>13</sup>	(1.7) If seeking approval, status of application

<sup>1</sup> Pre-mission questionnaire was prepared and sent on October 21 2009 to Fish and Fishery Products DG SANCO F3 European Commission.

<sup>2</sup> Competent authority for reporting purposes: Sanin Tanković, Secretary General, Veterinary Office of Bosnia and Herzegovina.

The former Yugoslav Republic of Macedonia	Yes	Dr Dejan Runteovski Director Veterinary Directorate, Ministry of Agriculture, Forestry and Water Economy Bul. Treta Makedonska Brigada bb 1000 Skopje	Yes	No (Candidate Country)	Currently expecting commencement of membership negotiations. The next phase in the accession process is acquiring negotiation date for EU membership.	No	
Montenegro	Yes	Dr Ivan Popovic Director Veterinary Administration Ministry of Agriculture, Forestry and Water Management Bul. Sv. Petra Cetinjskog 9 91000 Podgorica	No	No (Potential Candidate)	Currently in a phase of fulfilling EU questionnaire for candidate country.	Yes	
Serbia	Yes	Dr Zoran Micovic Chief Veterinary Officer Ministry of Agriculture, Forestry and Water Management Veterinary Directorate Omladinskih Brigada Street 1 11000 Belgrade	No	No (Potential Candidate)	Serbia unilaterally implements Stabilization and Accession Agreement	No	Preliminary (pre-mission) questionnaire in preparation <sup>3</sup>

<sup>3</sup> Although Croatia, BiH and Montenegro are listed as countries approved to export aquaculture products to the EU, there are some differences. Croatia is approved for live fish and product, and is seeking approval for shellfish; BiH is approved only for fish product (inland fish); and Montenegro is approved only for live seafish, not for products.

## **B. Legislation relevant to aquatic animal health**

### **Summary of results**

Results of the portion of the survey questionnaire dealing with national legislation relevant to aquatic animal health (Parts 1.8–1.9) are summarized in Table 1B. All participating countries indicated the existence of some national legislation relevant to aquatic animal health.

### **Analysis**

Among participating countries, relevant legislation is mainly contained in general veterinary regulations, some which are specific to aquaculture health (e.g. as in the case of BiH). Most countries have recently harmonized or are currently in the process of harmonizing their national legislation with the relevant EU Directives (see Annex I of blank survey form – Annex 1 of this document). Of the five participating countries, only Serbia and Montenegro indicated that national legislation is an important challenge (see Table 16B). However, a more in-depth review of relevant national legislation may be considered in conjunction with development of national aquatic animal health strategies and plans, which should be harmonized as far as possible, with national biosecurity, veterinary, aquaculture, conservation and marine resource law, and support standardized aquatic animal health procedures, as far as possible, across all participating countries.

**Table 1B. Existence of national legislation relevant to aquatic animal health for participating countries (Questionnaire Parts 1.8–1.9)**

<b>Country</b>	<b>(1.8) Relevant legislation exists?</b>	<b>(1.9) If yes, name and briefly describe all legislation and where applicable, indicate which specific EU directives or decisions the legislation conforms to (e.g. EU Directive 8/2006 which replaced 91/67/EEC, 93/53/EEC and 95/70/EEC) and others listed in Annex 1</b>
BiH	Yes	<ul style="list-style-type: none"> <li>• Decision on the requirements for import and transit passage of live animals, products and food of animal origin, medicines, fodder and wastes to Bosnia and Herzegovina</li> <li>• Decision on veterinary and health conditions that must be fulfilled when putting into trade live fishes, crayfishes and shellfishes, as well as the products obtained from them (“OJ BandH”, no: 62/05) – in compliance with 91/67/EEC</li> <li>• Decision on veterinary – health conditions which have to be fulfilled by processing plants intended for fish and fish products, crustaceans and crustaceans products breeding, producing and placing on market (“OJ BandH”, no: 05/04) – in compliance with CD/91/493/EEC</li> <li>• Decision on measures for protection from infectious and parasitic diseases, their implementation and financing in 2009 (“OJ BandH,” no: 04/09) – in compliance with 93/53/EEC)</li> </ul>

Croatia	Yes	<ul style="list-style-type: none"> <li>• Directive 88/2006, Directive 82/894, Decision 2002/878 and Decision 2001/183 are already transposed and implemented into Croatian national legislation.</li> <li>• Veterinary Act (O.G. 41/07)</li> <li>• Ordinance (OG 42/08) /Council Directive 2006/88 EU – Animal health requirements for aquaculture animals and products thereof, and on the prevention and control of certain diseases in aquatic animals</li> <li>• Ordinance (OG 142/08) /Decision EC 2002/878 – Diagnostic methods for detection and confirmation of bonamiosis and marteliosis</li> <li>• Ordinance (OG 142/08) / Decision EC 2001/183 – diagnostic methods for detection and confirmation of certain fish diseases (IHS,IHN)</li> <li>• Ordinance (OG 31/09) / Directive 82/894/EEC) on the notification of animal diseases</li> </ul>
The former Yugoslav Republic of Macedonia	Yes	<ul style="list-style-type: none"> <li>• Law on Veterinary Health (Official Gazette of The former Yugoslav Republic of Macedonia No.113/07)</li> <li>• Law on Veterinary Public Health (OG of RM No.114/07)</li> <li>• Law on Animal Protection and Welfare (OG of RM No.113/07)</li> <li>• Law on Animal By-products (OG of RM No.113/07)</li> <li>• Law on Safety of Foodstuffs and Products and Materials in Contact with Foodstuffs (OG of RM No 54/2002)</li> <li>• Related Book of Rules and Guidelines <ul style="list-style-type: none"> <li>- Book of Rules for the procedures and checks of the animals, products and by-products of animal origin intended for import and transit, the procedures for their notification at border inspection post and the framework of the minute for the results of the performed control (OG of RM No.129/08)</li> <li>- Book of Rules for the models of the veterinary health certificates for animal by-products accompanying consignments intended for import or transit into or through Republic of The former Yugoslav Republic of Macedonia (OG of RM 28/09)</li> <li>- Book of rules laying down methods and procedures for registration of legal entities providing import, and/or re-export as well as the model and content of documentation for import, and/or re-export (OG of RM No. 67/08)</li> <li>- Guideline on the list of animals, animal products and animal by-products that are subject to veterinary checks and controls by official veterinarian at border inspection post (prepared by the VD and approved by the Minister of MAFWE on 6.3.2008 No 11–3440/2)</li> <li>- Guideline on the list of animal feed, other products for animal nutrition and veterinary medical drugs that subject to veterinary checks and controls by official veterinarian at custom terminal (national provision, prepared by the VD and approved by the Minister of MAFWE on 1.4.2008 No 11-4900/1)</li> </ul> </li> </ul>
Montenegro	Yes	<ul style="list-style-type: none"> <li>• Veterinary Law</li> <li>• Food Safety Law</li> </ul>
Serbia	Yes	<ul style="list-style-type: none"> <li>• Only general provisions regarding animal health and import/export control are stipulated in Law on Veterinary Matters (OG RS No 91/05), with the list of notifiable animal diseases of special interest (OIE)</li> <li>• Regulations concerning prevention and eradication of certain trout diseases</li> </ul>

## **C. Trade in live aquatic animals and use of health certification**

### **C.1 Exportations**

#### **Summary of results**

Survey results relating to the export of live aquatic animals by participating countries are presented in Table 1C (Survey Questionnaire Parts 1.6–1.7). Only two countries (BiH and Croatia) indicated a limited export of live foodfishes. BiH exports both fingerlings and market-size trout and carps to neighbouring countries (Serbia and Montenegro), while Croatia exports both freshwater (carp, eel and others) and marine (tuna, seabass and seabream) fish to BiH and the European Union (total value of approximately US\$3 million). Respondents were unable to provide complete data on species/lifecycle stages, quantities and/or values of live exportations. In no case was exportation of live ornamental fishes noted.

Table 1D provides a summary of survey results relating to use and type of health certificates (HC) that are provided by exporting countries to their trading partners. BiH and Croatia both provide HCs for exported live aquatic animals at the request of importing countries. In all cases, certificates are to OIE standards, are as required by the importing country, and may include visual inspection or other standards.

#### **Analysis**

Exportation of live foodfishes by participating countries is currently quite limited. Analysis is hindered by a lack of precise data. This may indicate a lack of systematic and detailed record keeping on the part of participating countries. More detailed information on exportations and on future projections for aquaculture development is needed to fully understand trading patterns and the demands placed on CA for issuance of HC. More accurate and complete data on live exports, including information on species compositions, life history stages, numbers of animals by species, origins, health status, destinations, etc. should be systematically collected and stored in a national database in a format that is easily retrievable for use by policy planners.

To fully access international markets, participating countries will need to be able to provide HCs based on testing for pathogens as specified by importing countries to the standards given in the OIE *Aquatic Animal Health Code* and *Manual of Diagnostic Tests for Aquatic Animals*. Based on available information, BiH and Croatia appear to be able to completely fulfill the certification requirements requested by current trading partners and for currently traded commodities. Other countries may need to review and possibly upgrade diagnostics capability to achieve the high standards outlined by the OIE and required by potential trading partners such as the EU.

In the case of BiH, the current inability to access the EU market for live aquatic animals is due primarily to a lack of the required national disease status for certain diseases. BiH is collecting data in order to prove historical freedom from certain diseases, and regular monitoring programmes for infectious haematopoietic necrosis (IHN), viral haemorrhagic septicaemia (VHS), infectious pancreatic necrosis (IPN) and spring viraemia of carp (SVC) have been conducted for several years using diagnostic testing in accordance with OIE requirements.

**Table 1C. Summary of exportations of live foodfishes by participating countries (Questionnaire Parts 1.10–1.11)**

(1.7) If Yes, principal species exported, volumes, estimated values, destinations								
Country	(1.6) Exports aquatic animals?	Year	Species/life stage	Quantity (kg)	Value (US\$)	Destination

## C.2 Importations

### Summary of results

Survey results relating to the import of live aquatic animals by participating countries are presented in Table 1E (Survey Questionnaire Parts 1.14–1.15). All participating countries import some live aquatic animals. BiH imports trout eggs from Denmark, the United States of America and the Isle of Man (total of about 27.5 million pieces in 2008), seabass fingerlings (total of 2 250 000 pieces from Croatia and France in 2008); fingerlings of gilthead seabream (350 000 pieces from France and Italy), and larvae and fingerlings of common carp from Croatia and Serbia (fingerlings – 130 000 kg from Croatia; larvae – 5 500 000 kg and 18 900 000 pieces from Croatia and 5 000 000 pieces and 10 000 kg from Serbia; The former Yugoslav Republic of Macedonia imports live salmonids and cyprinids from Bulgaria, Greece and Serbia for both the restaurant trade and grow-out in aquaculture facilities (however, data is combined for both types of fish). Croatia imports ornamental freshwater and marine fish from a variety of sources (total value of US\$427 045 in 2008), freshwater foodfishes (trout, eel, carp and others) from BiH, Hungary and France (total value of US\$794 102); and marine foodfishes (tuna, seabass, seabream and others) from the EU, Libya, Morocco and Tunisia (total value of US\$12 823 425). Serbia indicated that some importation of live fish is occurring, but did not provide information on species or volumes.

Probably all participating countries import small numbers of freshwater ornamental fishes, however, only Croatia and The former Yugoslav Republic of Macedonia provided limited data on this aspect. As is often seen in the ornamental trade, the data for quantity of fish traded likely represents the total weight of shipments, including packing water and shipping materials.

Information on the nature of any health certificates demanded by importing countries from their trading partners is summarized in Table 1F (Summary Questionnaire Part (1.11)). All five countries indicated that importation of live aquatic animals requires some form of health certification. These generally appear to relate to statements from the veterinary authorities of exporting countries that the farm of origin is free from certain serious diseases of salmonids or cyprinids. Croatia and The former Yugoslav Republic of Macedonia note that they require import health certificates aligned with relevant EU regulations.

Table 1G summarizes information on any other risk management measures used by participating countries during importation of live aquatic animals (Summary Questionnaire Part 1.12). All five participating countries indicate some form of border checking and inspection (upon entry and/or at destination) occurs and that quarantine measures are applied.

### Analysis

More detailed information on importations is needed to fully understand trading patterns and identify any “risky” practices. A review of the information that the state requires from importers may be needed so that procedures for more accurate and complete data on species compositions, life history stages, numbers of animals by species, origins, health status, destinations, etc. are available. Record keeping needs to be improved so that this information is uniformly and systematically collected and stored in a format that is easily retrievable.

Although health certification requirements for importation appear to be in line with OIE procedures and EU directives, a more detailed review of the health certification requirements and border/postborder quarantine and testing requirements and procedures is needed before firm conclusions can be drawn.

**Table 1E. Summary of importations of live fishes (data for 2008) by participating countries (Questionnaire Part 1.14–1.15)**

Country	(1.14) Imports aquatic animals?	(1.15) If Yes, principal species imported, volumes, estimated values, sources				
		Year	Species/stage	Quantity <sup>1</sup>	Value (US\$)	Source
BiH	Yes	2008	Trout eggs	1 900 000 pcs		Denmark
				5 000 000 pcs		USA
				20 750 000 pcs		Isle of Man
			Seabass fingerlings	250 000 pcs		France
				2 500 000 pcs		Croatia
			Gildhead seabream fingerlings	250 000 pcs		France
				100 000 pcs		Italy
			Carp fingerlings	130 000 kg		Serbia
				18 900 000 pcs		Croatia
			Carp larvae	5 500 000 kg		Croatia
5 000 000 pcs		Serbia				
			10 000 kg		Serbia	

<sup>1</sup> Reporting for BiH has not been standardized; thus, figures obtained from Border Veterinary Inspection reports are given in either pieces or kilograms; although not indicated, kilogram values for carp fingerlings and larvae probably include shipping water and packing materials.

Croatia	Yes	2008	Ornamental freshwater fish	10 736 kg	395 237	Czech Republic, Indonesia, Italy, Israel, Hungary, Germany, Singapore, Slovakia, Thailand, Sri Lanka

<sup>2</sup>To 1 August 2009.

<sup>3</sup> Official data keeping on imports does not exist.

**Table 1F. Summary of health certification required from exporting countries for aquatic animals entering participating countries (Questionnaire Part 1.16, in Part).**

Country	Health certificate required?	Type of health certificate (HC) required			Notes
		International HC to OIE standards	As required by importing country (may be non-OIE standard)	As provided by exporting country	
BiH	Yes	Yes	Yes	Yes	Depending on the exporting country, Veterinary Office of BiH requires at least following: <ul style="list-style-type: none"> <li>• That the roe originates from fish and fish farms in which there are no any notifiable infectious diseases;</li> <li>• That the consignment was subjected to veterinary examination prior to dispatch and showed no clinical signs of diseases that can be transmitted by that particular species to other animals;</li> <li>• That fish originate from farms under veterinary health control, free of notifiable infectious diseases;</li> <li>• That the farm of origin is free of (depending on species): That the farm of origin is free of (depending on species): <ul style="list-style-type: none"> <li>- Viaremia vernalis cyprini</li> <li>- Aerocystitis cyprini</li> <li>- Erythrodermatitis cyprini</li> <li>- Septicaemia haemorrhagica salmonis</li> <li>- Necrosis infectiosa pancreatica salmonis</li> <li>- Furunculosis salmonis</li> <li>- Myxomiasis salmonis</li> </ul> </li> </ul>
Croatia	Yes	Yes	Yes	No	Import conditions are aligned with EU rules. Certificates regarding aquatic animals are aligned with those from Regulations 1250/2008 and 1251/2008.

The former Yugoslav Republic of Macedonia	Yes	Yes	No	No	AAH certificates required for import are in accordance with the appropriate EU AAH certification that originates from third countries. Certificates regarding AAH are aligned with those from Regulation 1251/2008. Model of the health certificate for ornamental fish is laid down in Annex III of the above regulation.
Montenegro	Yes	NR	NR	NR	That the farm of origin is free of (depending on species): <ul style="list-style-type: none"> <li>- Viaremia vernalis cyprini</li> <li>- Aerocystitis cyprini</li> <li>- Erythrodermatitis cyprini</li> <li>- Septicaemia haemorrhagica salmonis</li> <li>- Necrosis infectiosa pancreatica salmonis</li> <li>- Furunculosis salmonis</li> <li>- Myxomiasis salmonis</li> </ul>
Serbia	Yes	Yes	Yes	Yes	Depends upon agreement with exporting country; all types of international certificates could be valid if previously agreed with Serbia's CCA

**Table 1G. Summary of other controls or risk management measures applied to imported aquatic animals by participating countries (Questionnaire Part 1.17)**

<b>Country</b>	<b>(1.17) Other controls or risk management measures applied to imported aquatic animals</b>
BiH	<ul style="list-style-type: none"> <li>• Veterinary inspection at border crossing, place of destination and quarantine measures</li> </ul>
Croatia	<ul style="list-style-type: none"> <li>• At the border, veterinary inspectors check consignment and take samples for prescribed testing.</li> <li>• Live animals have to be put into quarantine and checked for health status.</li> </ul>
The former Yugoslav Republic of Macedonia	<ul style="list-style-type: none"> <li>• Veterinary checks and controls at border inspection posts (BIPs) are performed by official veterinarians – one stop control: documentary check, identity check and physical check.</li> <li>• After import, live animals have to be quarantined and checked for health status.</li> </ul>
Montenegro	<ul style="list-style-type: none"> <li>• Veterinary inspection at border crossing, place of destination and quarantine measures</li> </ul>
Serbia	<ul style="list-style-type: none"> <li>• At the border, veterinary inspectors check consignment and take samples for prescribed testing.</li> <li>• Live animals have to be put into quarantine and checked for health status.</li> </ul>

#### **D. Risk analysis capacity**

##### **Summary of results**

The current capacity of participating countries to undertake pathogen risk analysis is summarized in Table 1H (Summary Questionnaire Parts 1.18–1.21). Only two of the five countries (BiH and The former Yugoslav Republic of Macedonia) indicate some capacity in this area. In all cases, risk analysis for aquatic animal commodities is not linked with evaluation of other sorts of risks (ecological, genetic, environmental, etc.)

##### **Analysis**

Governments must often make decisions having far-reaching social, environmental and economic consequences based on incomplete knowledge and a high degree of uncertainty. Risk analysis is a structured process that provides a flexible framework within which the risks of adverse consequences resulting from a course of action can be evaluated in a systematic, science-based manner. The risk analysis approach permits a defensible decision to be reached on whether the risk posed by a particular action is acceptable or not, and provides the means to evaluate possible ways to reduce an unacceptable risk to one that is acceptable.

A pathogen risk analysis (termed import risk analysis or IRA when applied to international trade) analyses the risks of introducing and/or spreading exotic pathogens or strains into new geographic areas along with the international or domestic movement of aquatic animal commodities. With the adoption of the SPS Agreement in 1994, WTO member countries are required to use risk analysis as a means to justify any restrictions on international trade in live aquatic animals or their products based on risk to human, animal or plant health, including the application of sanitary measures beyond those outlined in the OIE Code. As a result, risk analysis is now an internationally accepted method for deciding whether trade in a particular commodity poses a significant risk to human, animal or plant health and, if so, what measures could be applied to reduce that risk to an acceptable level.

A key problem with conducting pathogen risk analysis is the large amount of uncertainty that is often encountered due to a general lack of basic knowledge on pathogens of aquatic animals, including their identities, life cycles, ecology, host specificity, pathogenicity, etc. Thus along with the development of risk analysis expertise, countries also need to establish appropriate supporting activities such as disease information databases, targeted research, diagnostics capability, surveillance and monitoring, etc.

There appears to be little capability or experience with aquatic pathogen risk analysis in participating countries. While two countries (BiH, The former Yugoslav Republic of Macedonia) indicated that expertise related to conducting risk analysis is present, neither cited examples of commodity-based pathogen risk analyses that have been conducted. There is thus a need to increase capacity through regional and national training programmes in pathogen risk analysis, to develop appropriate regional or national structures for conducting risk analyses for key aquatic species and, as part of regional and national strategies, to develop capacity in other areas of aquatic animal health to support risk analysis. There is also a need to coordinate pathogen risk analyses with ecological and genetic risk analyses where proposals to introduce new species for aquaculture development are received.

**Table 1H . Summary of capacity to conduct risk analyses for proposed movements of live aquatic animals in participating countries (Questionnaire Parts 1.18–1.21)**

Country	(1.18) Is there expertise to conduct import risk analysis (IRA) for aquatic animal pathogens?	(1.19) If Yes, details of agency(ies) having expertise and examples of IRAs undertaken	(1.20) Is pathogen RA linked with evaluation of other risks (e.g. ecological, pest, invasive alien species, genetic risks)?	(1.21) If Yes, how is this accomplished ?
BiH	Yes	Veterinary Office of BiH	No	
Croatia	No		NA	
The former Yugoslav Republic of Macedonia	Yes	MAFWE – Veterinary Directorate <ul style="list-style-type: none"> <li>• Imports of animals, products or animal by-products may be banned, or conditions for imports amended, by decision laid down by the CVO in cases of an outbreak of a contagious animal disease or any other incident in the country of origin which may pose a risk to animal or public health, according to: <ul style="list-style-type: none"> <li>▪ OIE animal diseases status and updates</li> <li>▪ Official journal of European Union diseases updates</li> <li>▪ Risk analysis results</li> </ul> </li> </ul>	No	
Montenegro	No		NA	
Serbia	No		NA	

## **SECTION 2. CONTROL OF DOMESTIC MOVEMENTS OF LIVE AQUATIC ANIMALS AND OTHER DOMESTIC ACTIVITIES THAT MAY SPREAD PATHOGENS**

### **Summary of results**

A summary of the status of regulations present in participating countries pertaining to activities that may prevent the domestic spread aquatic animal pathogens is given as Table 2 (Questionnaire Parts 2.1–2.4). All countries indicated the presence of capacity to regulate the domestic movement of live aquatic animals. All countries but one (Serbia) indicated capacity to regulate the disposal of waste products from processing plants. In BiH and Montenegro, regulation is done at the municipal level, while in Croatia and The former Yugoslav Republic of Macedonia, it is the responsibility of the national or state authorities.

### **Analysis**

The ability to regulate the domestic movement of live aquatic animals can be an important tool for risk management and can be used, for example, to limit the use and distribution of new and exotic aquaculture species until their health status and the absence of any unpredicted ecological impacts is confirmed. It is also an essential component of contingency planning to restrict pathogen spread during a major disease outbreak, and is required for zoning, to help countries maintain the disease-free status of uninfected zones. For countries having significant freshwater aquatic systems or long marine coastlines, disease zoning and control may be possible and measures for domestic control of movements may be desirable. On a regional basis, it is possible that disease zoning could be applied to shared freshwater and marine ecosystems.

The unsafe disposal of aquatic animal wastes (including processing water) from seafood processing plants represents a potential source for transmission of viruses and other aquatic animal pathogens. In countries where commercial processing takes place, the governmental agencies charged with regulating processing plants should be identified and current regulations and procedures (e.g. Hazard Analysis and Critical Control Points [HACCP], better management practices [BMPs]) should be reviewed to confirm that there are adequate safeguards to ensure that wastes and waste waters are properly treated or disposed of in a manner that will prevent the release of any viable pathogens into the environment.

**Table 2. Summary of status of regulations pertaining to activities that may prevent domestic spread aquatic animal pathogens by participating countries (Questionnaire Parts 2.1–2.4)**

Country	(2.1) Regulations on in-country movement of aquatic organisms?	(2.2) If Yes, brief description of controls, contact details of responsible agencies, legislation providing authority for control	(2.3) Regulations on waste disposal from seafood processing plants?	(2.4) If Yes, brief description of controls, contact details of responsible agencies, legislation providing authority for control
BiH	Yes	<ul style="list-style-type: none"> <li>In accordance with the decision on veterinary certificate on health status of the animals and consignments of animal origin in internal and foreign trade, each consignment (live animals or animal products) has to be followed by the form stating that the consignment fulfills all necessary health standards. ## SECTION 3. POLICY AND PLANNING

### Summary of results

A summary of the current status of policy and planning for aquatic animal health in participating countries is presented Table 3A (Survey Questionnaire Parts 3.1–3.2) and Table 3B (Survey Questionnaire Parts 3.3–3.7). Only two countries (BiH and Serbia) indicated that a specific agency was identified as responsible for national aquatic animal health matters. Two countries (Croatia and Montenegro) have aquatic animal health policy officially expressed in the form of national legislation, while another country (BiH) has a National Aquatic Animal Health Strategy (prepared under FAO project TCP/BiH/3101), but which is not yet officially adopted as a national policy document. With regard to the involvement of subnational entities in setting national aquatic animal health policy, only BiH indicated that this occurred.

Table 3C presents summary information on estimates of the effectiveness of current policy (Survey Questionnaire Part 3.8 (a-c)). Croatia indicated that current policy and planning was thought to be adequate in preventing the entry and spread of pathogens, adequate for the domestic control of serious diseases, and effectively implemented, while BiH indicated that planning for preventing the entry and spread of pathogens and for the domestic control of serious diseases were both adequate, but that implementation was inadequate. Three countries (The former Yugoslav Republic of Macedonia, Montenegro and Serbia) indicated that current policy and planning are inadequate for preventing the entry and spread of pathogens, inadequate for the domestic control of serious diseases, and are not effectively implemented.

Table 3D summarizes for each country, the specific areas addressed by national policy (Survey Questionnaire Part 3.9). BiH and Croatia indicated that all areas were addressed by policy, while The former Yugoslav Republic of Macedonia, Montenegro and Serbia felt that the technical areas of disease diagnostics and farm-level treatment and prevention of diseases were adequately addressed (as well as, in the case of Montenegro, international treaties, memberships and linkages) but that other areas such as risk analysis; emergency preparedness; infrastructure; financial requirements and planning; international treaties, memberships and linkages; and communication (interagency, stakeholder) were not.

Table 3E summarizes responses concerning the current priorities for national aquatic animal health policy in participating countries (Survey Questionnaire Part 3.10). For BiH and Montenegro, emphasis is on harmonizing legislation with the EU, implementing risk analysis, improving diagnostic capabilities, establishing national disease surveillance programmes and improving communication with stakeholders (Montenegro also listed capacity building in inspection and good manufacturing practices, and categorization of aquaculture farms). Croatia's priorities include classifying aquaculture facilities according to health status, disease zoning, implementing monitoring and surveillance programmes and developing contingency plans for aquatic animal diseases. Priorities for The former Yugoslav Republic of Macedonia include farm classification, monitoring and surveillance, contingency planning, implementing risk analysis and improving diagnostics. Serbia seeks to build aquatic animal health capacity, develop or improve relevant legislation and increase training opportunities.

### Analysis

In all countries, the agencies responsible for ensuring aquatic animal health are the veterinary services (national, state or entity, and municipal or local).

Development of a national strategy on aquatic animal health within the broader framework of biosecurity policies or aquaculture development plans is being promoted by FAO. A national strategy contains a comprehensive framework that will allow countries to protect aquatic animal health, ensure healthy aquatic production, comply with international obligations, etc. A national strategy contains many of the essential elements for a successful aquatic animal health protection programme. These include national coordination and priority setting, legislation and policy, pathogen list, institutional

resources, diagnostics, disease zoning, surveillance and reporting, health certification and quarantine, contingency planning, pathogen risk analysis, capacity building, communication, farmer/private sector engagement, financial resources, surveillance and monitoring, and evaluation and regional and international cooperation.

The development of formal strategies, policies and plans for aquatic animal health in participating countries (as has been done in BiH) should be a priority. For most countries, formulation of a clear national policy that states a vision for national aquatic animal health and outlines the means of achieving it would be desirable. The incorporation of aquatic animal health issues related to international and domestic disease control and prevention into broader programmes of national biosecurity that include components for terrestrial animals and plants also has many advantages, including development of standardized procedures and methods across all commodities and cost effectiveness with regard to shared expertise and facilities.

The current priorities for national aquatic animal health as identified by the survey indicate a shared need to develop effective planning and associated technical capacity. Common themes include improving or establishing monitoring and surveillance programmes, registering and classifying (by disease status) aquaculture production facilities, improving capacity for risk analysis and disease diagnosis, contingency planning and improving and harmonizing legislation. All of these activities would be done so as to improve conformance with the relevant EU directives.

**Table 3A. Summary of status of policy and planning for aquatic animal health (AAH) in participating countries (Survey Questions 3.1–3.2)**

Country	(3.1) National responsible agency designated?	(3.2) If Yes, indicate:	
		Name of responsible agency/department	Responsibilities
BiH <sup>1</sup>	Yes	<p>The Veterinary Office of BiH under the Ministry of Foreign Trade and Economic Relations was established in 2001 as a Central Competent Authority in Veterinary Service at the State level.</p> <p>Entity ministries of agriculture, water management and forestry including Brčko District (regional level)</p> <p>Veterinary Inspectorates are organized at the entity level.</p> <p><u>Veterinary Organizations</u> (private and public-sector practitioners)</p>	<p>Competencies, duties and powers of the Veterinary Office of BiH are given by the Veterinary Law. The office is in charge of: (a) issuance of legislation, (b) issuance of veterinary HCs and import licenses, (c) border veterinary controls, (d) drafting of disease surveillance programmes, (e) drafting of residue monitoring plans, (f) operation of diagnostic laboratories and (g) all other issues related to international traffic of live animals and products of animal origin, and the veterinary health conditions in the establishments. The Veterinary Inspection Department includes the Border Veterinary Inspection and is an integral part of the VO BiH, which is also in charge of animal identification and movement controls through the Agency for Animal Identification and Movement Control located in Banja Luka.</p> <p>In charge of the implementation of legislation issued at the state level. They have the obligation to implement disease control and food safety programmes. Furthermore, they have a right to issue sub-law documents that are not covered by the state legislation.</p> <p>Implementation of inspection related to enforcement of health surveillance, food safety, application of standards in facilities and movement of live animals and products of animal origin.</p> <p>Implementing of primary health care, including vaccination and treatment of animals. Together with the veterinary inspectors, they present the first line in disease control.</p>

<sup>1</sup> After signing of the Dayton Peace Agreement, BiH was divided into three administrative units: the Federation of BiH, the Republic of Srpska and Brčko District of BiH (referred to as the Entities).

## SECTION 4. LEGISLATION

### Summary of results

Development of essential enabling legislation is a key component of a national aquatic animal health strategy. Table 4 summarizes the status of national legislation dealing with aquatic animal health policy for participating countries (Survey Questionnaire Parts 4.1–4.3). All countries have legislation supporting aquatic animal health policy. Such support is typically incorporated into general veterinary laws and regulations. Four participating countries (BiH, Croatia, The former Yugoslav Republic of Macedonia and Serbia) indicated that some separate laws or regulations specific to aquatic animal health exist. Four countries (BiH, The former Yugoslav Republic of Macedonia, Montenegro and Serbia) indicated that some of their current legislation is in need of major review or revision.

### Analysis

Participating countries may need to conduct a review of the effectiveness of existing legislation as part of a long-term policy and planning exercise. National legislation should be reviewed to ensure that the legal mechanisms are in place to support aquatic animal health activities and to ensure harmonization with relevant EU directives. The FAO Legal Office may provide FAO Member Countries with assistance in the review and revision of national legislation related to fisheries, aquaculture and aquatic animal health.

**Table 4A. Status of legislation dealing with aquatic animal health in participating countries (Survey Questionnaire Parts 4.1–4.3)**

## **SECTION 5. DISEASE SURVEILLANCE/MONITORING**

### **Summary of results**

The current status of surveillance and monitoring programmes for plant and animal diseases in participating countries and the existence of aquatic animal health information systems are summarized in Tables 5A and 5B, respectively (Survey Questionnaire Parts 5.1–5.3 and Part 5.4). All countries indicate that some form of official surveillance or monitoring programme exists. Most common are official programmes for surveillance and monitoring of diseases of terrestrial animals (all countries), while some form of surveillance and monitoring programme for aquatic animal diseases is indicated to be present in all countries but Serbia (where is expected to be initiated in the near future).

While all countries having aquatic animal surveillance programmes collect and analyze this data, it is unclear from survey responses to what extent information systems for storing, handling and analyzing data have been developed.

### **Analysis**

Disease surveillance is a fundamental component of any official aquatic animal health protection programme. Surveillance and monitoring programmes for aquatic animal diseases are essential to detection and rapid emergency response to serious disease outbreaks and form the basis for early warning of emerging disease outbreaks. They are also increasingly demanded by trading partners to support statements of national disease status and are the basis for disease zonation. Surveillance also provides the building blocks of information necessary to have an accurate picture of the distribution and occurrence of diseases relevant to disease control and international movement of aquatic animals and their products.

There appears to be a need to establish surveillance and monitoring programmes for countries where these are lacking (Serbia), and improve and expand these programmes where they are already established (all other countries). Surveillance can be passive (reactive and general in nature) or active (proactive and targeted). In both cases there must be adequate reporting mechanisms so that suspected cases of serious pathogens are quickly brought to the attention of the lead agency. Surveillance and monitoring efforts must be supported by adequate diagnostics capability (including appropriately trained expertise, suitably equipped laboratory and rapid-response field diagnostics, and standardized field and laboratory methods), information system management (i.e. a system to record, collate and analyze data and to report findings), legal support structures, transport and communication networks and linked to national and international (OIE) disease reporting systems (e.g. pathogen list or list of diseases of concern, disease notification and reporting procedures). Current surveillance and monitoring programmes for some countries may not meet OIE standards for recognition of disease-free status.

Establishing a cooperative regional disease surveillance programme for key diseases of cultured aquatic animals (OIE listed diseases) should be considered, as well as harmonized procedures for data collection, storage and analysis.

**Table 5A. Current status of surveillance and monitoring programmes for plant and animal diseases in participating countries (Survey Questionnaire Parts 5.1–5.3)**

<b>Country</b>	<b>AAH information system exists?<sup>1</sup></b>	<b>If Yes, responsible institution and facilities</b>
BiH	Yes	<ul style="list-style-type: none"> <li>Data concerning monitoring programmes and fish farms are collected at the Veterinary Office of BiH.</li> </ul>
Croatia	Yes	<ul style="list-style-type: none"> <li>Analysis of data gathered from laboratory testing is done by the Croatian Veterinary Institute</li> <li>Surveillance data are analyzed in the Veterinary Directorate, Animal Health Sector</li> </ul>
The former Yugoslav Republic of Macedonia	Yes	<ul style="list-style-type: none"> <li>Analysis of data gathered from laboratory testing is done by Faculty of Veterinary Medicine in Skopje. Surveillance data are analysed in the Veterinary Directorate.</li> </ul>
Montenegro	Yes	<ul style="list-style-type: none"> <li>Analysis of data gathered from laboratory testing is done by Diagnostic Veterinary Laboratory. Surveillance data are collected in the Veterinary Administration, Animal Health Sector.</li> </ul>
Serbia	No	

<sup>1</sup>Both BiH and The former Yugoslav Republic of Macedonia indicated that surveillance and monitoring must be improved.

## SECTION 6. DISEASE DIAGNOSTICS

### Summary of results

A summary of disease diagnostics capability in participating countries is presented in Tables 6A–6B. Table 6A indicates the ability to diagnosis those diseases listed by the OIE (Survey Questionnaire Parts 6.1–6.2). According to the survey responses, no country has the capability to diagnosis all OIE-listed diseases, BiH is able to diagnose some diseases in all categories (molluscan, crustacean and finfish diseases), Croatia can diagnose some crustacean diseases and all molluscan and finfish diseases, The former Yugoslav Republic of Macedonia can diagnose some finfish diseases, Montenegro can diagnose some molluscan and finfish diseases, and Serbia can diagnose some molluscan and crustacean diseases and all finfish diseases.

Table 6B summarizes the status of diagnostic laboratories in participating countries, indicating whether they are officially designated national laboratories, laboratories accredited as international or national reference centres, or other public or private-sector laboratories (Summary Questionnaire Parts 6.2–6.8). Three countries (BiH, Croatia and The former Yugoslav Republic of Macedonia) indicated that national laboratories responsible for aquatic animal health have been designated. Only one country (Serbia) indicated the presence of an accredited laboratory (nationally accredited by the Accreditation Board of Serbia for microbiological analyses of animal specimens) and four countries (BiH, Croatia, Montenegro and Serbia) indicated the existence of some diagnostic capability in other public or private-sector laboratories.

Table 6C summarizes the status of national pathogen lists for participating countries (Survey Questionnaire Parts 6.9–6.10). All countries except Montenegro noted the existence of a national pathogen list.

### Analysis

Disease diagnostics plays two significant roles in health management and disease control. The first role of diagnostics is to ensure that stocks of aquatic animals that are intended to be moved from one area or country to another are not carrying infection by specific pathogens at subclinical levels and is accomplished through screening of healthy animals. The second equally important role of diagnostics is to determine the cause of unfavourable health or other abnormalities in order to recommend measures appropriate to a particular situation. Disease diagnostics is also an important supporting component of surveillance and monitoring programmes, contingency planning and emergency response.

The capacity to provide rapid, accurate diagnosis of aquatic animal diseases is an important part of a national aquatic animal health plan. Issuance of international health certificates based on the demonstrated ability to diagnose diseases using the standards and diagnostics tests specified by the OIE Code and Manual for OIE-listed molluscan, crustacean and finfish diseases is increasingly required by importing countries.

In general, participating countries have access to well-equipped veterinary laboratories (either directly via national laboratories or by agreement with the veterinary faculties of local universities). These laboratories are generally able to diagnose the limited number of OIE-listed diseases that are of concern to national aquaculture (e.g. listed diseases of salmonids and cyprinids). In the case where specific capacity is lacking, some laboratories are able to access expertise at international reference laboratories, although the costs of such services may be prohibitive. There is no regional aquatic animal health laboratory and none of the existing national laboratories is an OIE reference center for aquatic animal disease diagnosis.

National pathogen lists should include only those diseases that meet a stringent set of criteria (see FAO/NACA, 2000).<sup>1</sup> These are:

- (i) Presence or absence of the disease or pathogen in the importing country – The disease or pathogen should be:
- exotic to the entire country, or
  - occurring in parts of the country, but there are zones that are officially recognized as free and that need to be protected, or
  - occurring in parts of the country, and the country is running a control programme to minimize spread of the disease and/or to eradicate it.
- (ii) Pathogenicity – The disease or pathogen has a significant adverse affect on host health.
- (iii) Infectious etiology – The disease is caused by an infectious agent that is transmissible horizontally and/or vertically, as well as directly or indirectly (via carriers or intermediate hosts existing in the receiving waters).
- (iv) Adverse socio-economic, public health or ecological impacts – The disease or pathogen is known or likely to cause significant adverse socio-economic, public health or ecological impacts.

Importantly, a pathogen should not be listed if it:

- occurs widely within the region with no infectious mortality or
- has no socio-economic impact, or
- is controlled through improved husbandry handling (nonchemotherapeutic intervention).

The results of the survey show that the national pathogen lists of participating countries are generally based on the OIE disease list and include only those OIE-listed diseases that are relevant to the national and regional situation.

There is a clear need to improve the national disease diagnostics capability for specific diseases in some countries (Montenegro, for example, needs capacity to diagnose OIE-listed viral diseases of salmonids and marine cage fish, and for bonamiosis and martielliosis of molluscs).

**Table 6A. Summary of ability to diagnose OIE-listed diseases in participating countries (Survey Questionnaire Parts 6.1–6.2)**

Country	(6.1) Adequate capacity to diagnose OIE-listed diseases?	(6.2) If Yes, capacity to diagnosis OIE-Listed		
		Molluscan diseases	Crustacean diseases	Finfish diseases
BiH	Yes	Yes (some)	Yes (some)	Yes (some)

**Table 6C. Summary of status of national pathogen list for participating countries (Survey Questionnaire Parts 6.9– 6.10)**

Country	(6.9) National pathogen list exists?	(6.10) If Yes, criteria for listing pathogens/diseases listed
BiH Croatia	Yes Yes	OIE and EU-listed diseases Ordinance laying down the rules for disease notification (OG 31/09) contains the list of diseases that are compulsorily notifiable to competent authority. OIE standards are used regarding inclusion of disease on the list.
The former Yugoslav Republic of Macedonia	Yes	List of diseases that are compulsorily notifiable to competent authority according to the OIE's <i>Aquatic Animal Health Code and</i> according to the: <ul style="list-style-type: none"> <li>- Council Directive 82/894/EEC of 21 December 1982 on the notification of animal diseases within the Community;</li> <li>- 2008/755/EC: Commission Decision of 24 September 2008 amending Decision 2005/176/EC laying down the codified form and the codes for the notification of animal diseases pursuant to Council Directive 82/894/EEC;</li> <li>- Council Directive 2006/88/EC of 24 October 2006 on animal health requirements for aquaculture animals and products thereof, and on the prevention and control of certain diseases in aquatic animals</li> </ul>
Montenegro Serbia	No Yes	The following diseases are an integral part of the Law on Veterinary Matters: <ul style="list-style-type: none"> <li>- Spring viraemia of carp</li> <li>- Viral haemorrhagic septicaemia</li> <li>- Infectious haematopoietic necrosis</li> <li>- Epizootic haematopoietic necrosis</li> <li>- Oncorhynchus masou virus disease</li> <li>- Viral encephalopathy and retinopathy</li> <li>- Gyrodactylus salaris</li> <li>- Enteric septicaemia of catfish</li> <li>- Infectious pancreatic necrosis</li> <li>- Bacterial kidney disease (renibacteriosis)</li> <li>- White sturgeon iridoviral disease</li> <li>- Red sea bream iridoviral disease</li> <li>- Infectious salmon anemia</li> </ul>

## **SECTION 7. EMERGENCY PREPAREDNESS/CONTINGENCY PLANNING**

### **Summary of results**

A summary of the current status of emergency preparedness and contingency planning for outbreaks of aquatic animal disease in participating countries is presented in Table 7 (Survey Questionnaire Parts 7.1–7.3). No country indicated that contingency planning exists for aquatic animal disease outbreaks, while all countries indicated that an emergency response plan for one or more terrestrial animal diseases has been prepared.

### **Analysis**

Emergency preparedness is the ability to respond effectively (via early detection) and in a timely fashion (rapid response) to disease emergencies (e.g. disease outbreaks, mass mortalities). The capability to deal with emergency diseases requires a great deal of planning and coordination (including establishing operational, financial and legislative mechanisms) and making available required resources (i.e. skilled personnel and essential equipment).

As long as there is importation of live aquatic animals, there exists the possibility of a serious disease outbreak due to an exotic pathogen or strain. Risk analysis and risk mitigation measures help to reduce the likelihood of a serious disease event occurring, but even under the best circumstances, pathogens will occasionally escape detection, breach national barriers, become established, spread and cause major losses. The extent to which losses occur often depends of the quickness of detection (which depends on the effectiveness of disease surveillance, diagnostics and reporting programmes) and the rapidity and effectiveness with which governments recognize and react to the first reports of serious disease. As quick and effective reaction is largely dependent upon contingency planning, Participating countries need to develop such plans for key cultured species and diseases.

**Table 7. Current status of emergency preparedness/contingency planning for outbreaks of aquatic animal disease in participating countries (Survey Questionnaire parts 7.1–7.3)**

Country	(7.1) Contingency or emergency response plans exist?	(7.2) If Yes, details of plan(s)	(7.3) If No, brief description of any emergency response plans for terrestrial animal diseases, terrestrial plant pests or invasive pest species, including responsible agency/ies and supporting legislation
BiH	No		<p>Avian Influenza Contingency Plan is developed by the Veterinary Office of BiH in cooperation with the entity competent authorities and FAO. Plan is developed on the basis of EU/OIE/FAO/WHO recommendations.</p> <p>Besides agencies listed in section 3, point 3.2., Plan anticipates engagement of the police, human public health authorities and crisis centres.</p>
Croatia	No		<p>Contingency plans are developed for CSF, BT, AI and BSE. MAFRD, Veterinary Directorate develops contingency plans for diseases that are most important to the country. Rules to be included into contingency plans are prescribed in the Ordinances regarding specific diseases. Also OIE recommendations are used while preparing contingency plans.</p>

---

The former Yugoslav Republic of Macedonia	No	<p>The Law on Veterinary Health defines the activities and obligations related to the control and eradication of harmful contagious diseases. A general contingency plan was adopted in 2007. It defines the legal requirements, responsibilities, organizational structure, chain of command, information flow, resources (human, financial and material), responsibilities of national disease control centre, local disease control centres, expert groups, training and public awareness.</p> <p>Contingency plans for Avian Influenza (adopted and published in OG 82/2007); Bluetongue (adopted and published in OG 84/2007) and Foot and Mouth Disease have been developed and adopted by the government in 2008. As regards Classical Swine Fever, a regional and national project funded by European IPA and TAIEX funds is foreseen to be implemented in 2009. One of the objectives is to define a contingency and eradication plan for the disease.</p> <p>Programmes for eradication of Brucellosis and Tuberculosis in cattle are adopted in OG 22/2007 and a programme for eradication of Brucellosis in sheep and goats is adopted and published in OG 59/2008.</p>
Montenegro Serbia	No No	Contingency plan exists only for Avian Influenza. Responsible agency is the Veterinary Directorate

---

## **SECTION 8. EXTENSION SERVICES**

### **Summary of results**

A summary of the current status of extension services that support the prevention of aquatic animal diseases in aquaculture facilities in participating countries is presented in Table 8 (Survey Questionnaire Parts 8.1–8.3). According to respondents, extension services exist in all countries but Montenegro and Serbia.

### **Analysis**

Individual countries should consider the need for extension services to the aquaculture industry and the best methods of delivering these services. Often the aquaculture sector can deliver its own extension services; however, in some cases, government extension services, either by training of veterinary extension officers in the basics of aquatic animal health, or through specific health-related extension and diagnostic services can be considered. Extension officers can also serve to monitor basic health conditions in aquaculture facilities and provide a basis for passive disease surveillance by serving as a liaison with aquaculturists.

**Table 8. Summary of current status of extension services that support the prevention of aquatic animal diseases in aquaculture in participating countries (Survey Questionnaire parts 8.1–8.3)**

Country	(8.1) Extension services exist?	(8.2) If Yes, description of services, name and contact details of responsible agency(ies), No. of staff and their specific areas	(8.3) If No, agency mandated to fulfill this function and contact details
BiH	Yes	<ul style="list-style-type: none"> <li>• Veterinary Office of BiH is charged with monitoring the world epidemiological situation concerning animal diseases and to issue adequate measures.</li> <li>• In accordance with legislation, veterinary inspectors are obliged to constantly monitor the health status of farms, together with the veterinary organizations.</li> </ul>	
Croatia	Yes	<ul style="list-style-type: none"> <li>• Competent authority (MAFRD, Veterinary Directorate), authorized veterinarians as well as the national laboratory for fish disease provide for support in prevention of AAD.</li> </ul>	
The former Yugoslav Republic of Macedonia	Yes	<ul style="list-style-type: none"> <li>• The Performance of veterinary services (PVS) are authorized to carry out certain animal health protection measures against infectious diseases within the primary veterinary health activity. The authorized PVS implement the annual order from MAFWM for prevention, control and eradication of animal contagious diseases. They are under the supervision of the official veterinarians. They also issue certificates on animal health conditions. 80% of the funds generated from the fees are income of the national budget and 20% is income of the authorized PVS. Authorized PVS maintain records of all activities, observations and results and submit monthly reports to Regional Veterinary Offices and Animal Health Sector.</li> </ul>	
Montenegro Serbia	No No		<p style="text-align: center;">NR</p> <ul style="list-style-type: none"> <li>• Veterinary Directorate of MAFWM is responsible for these issues</li> </ul>

## **SECTION 9. COMPLIANCE/ENFORCEMENT**

### **Summary of results**

A summary of the current status of capacity for compliance/enforcement of regulations on aquatic animal health in participating countries is presented in Table 9 (Questionnaire Parts 9.1–9.6). All countries have compliance services that monitor and enforce international trade in live aquatic animals, including aquatic animal health regulations; have compliance services that monitor and enforce domestic trade in live aquatic animals, including aquatic animal health regulations; and have regulations related to disease prevention and control in aquaculture facilities.

### **Analysis**

Capacity to enforce aquatic animal health regulations is an essential component of a national aquatic animal health plan. This includes ensuring border compliance with regard to import and export of live aquatic animals (usually done by quarantine officers and customs officials located at points of entry) and enforcement of regulations pertaining to an array of domestic concerns, including use of drugs and chemicals for disease treatment, control of domestic movements, enforcement of zoning regulations, inspection of aquaculture premises, etc. Such activities are usually conducted by veterinary officers who may have special training and powers of enforcement.

Countries should review the effectiveness of current compliance and enforcement capacity and where warranted, incorporate planning for staffing, training and regulatory support to ensure adequate compliance. Self-enforcement by aquaculture producers groups through use of BMPs and HACCP can be effective in improving compliance with regulations, as are communication programmes targeting risky practices by aquaculturists and the general public.

**Table 9. Current status of capacity for compliance/enforcement of regulations on aquatic animal health (AAH) in participating countries (Survey Questionnaire Parts 9.1–9.6)**

Does country have compliance services that monitor and enforce:						
Country	(9.1) International trade in live aquatic animals, including AAH regulations?	(9.2) If Yes, brief description of service, name and contact details of responsible agency(ies), No. of staff involved and supporting legislation	(9.3) Domestic movements of live aquatic animals, including AAH regulations?	(9.4) If Yes, brief description of service, name and contact details of responsible agency(ies), no. of staff involved and supporting legislation	(9.5) Regulations related to disease prevention, management and control in aquaculture facilities?	(9.6) If Yes, brief description of service, name and contact details of responsible agency(ies), no. of staff involved and supporting legislation
BiH	Yes	<ul style="list-style-type: none"> <li>• Veterinary Office of BiH and Foreign Trade Associations.</li> <li>• Relevant legal documents are:               <ul style="list-style-type: none"> <li>- Veterinary Law of Bosnia and Herzegovina</li> <li>- Decision on veterinary certificate on health status of the animals and consignments of animal origin in internal and foreign trade</li> <li>- Decision on the requirements for import and transit passage of live animals, products and food of animal origin, medicines, fodder and wastes to Bosnia and Herzegovina</li> </ul> </li> </ul>	Yes	As described in points: 1.9, 2.2, 3.2	Yes	As described in points: 1.9, 3.2, 4.2, 5.3

---

## **SECTION 10. RESEARCH**

### **Summary of results**

Survey results detailing the status of current research activity for aquatic animal health in aquaculture in participating countries are summarized in Table 10 (Survey Questionnaire Parts 10.1–10.2). Respondents for four countries (Croatia, The former Yugoslav Republic of Macedonia, Montenegro and Serbia) indicated the existence of related research.

### **Analysis**

Research capacity in aquatic animal health is necessary to the successful expansion of aquaculture development. Targeted and basic research can lead to better disease management, better understanding of national aquatic animal health status, support to risk analysis, improved diagnostic methods, etc.

The limited amount of specific research capacity in participating countries means that countries must often rely on research conducted by scientists in other nations. Often, such “borrowed” research may not be directly applicable to local situations and experimental testing must be undertaken to adapt these findings. In other cases, little or no relevant information on the specific problem may be available.

There are many mechanisms to improve access to research capacity. These include development of national aquatic animal health research laboratories, supporting linkages and research programmes within universities and the private sector, contracting of targeted research with foreign institutions, and development of a regional aquatic animal health centre. Countries should develop their individual strategies to ensure adequate access to research to support national priorities in aquatic animal health.

**Table 10. Summary of current research activity in aquatic animal health (AAH) in aquaculture in participating countries (Survey Questionnaire Parts 10.1–10.2)**

Country	(10.1) Existence of research activity including AAH in its scope?	(10.2) If Yes, brief description of research, institute, No. of staff and students involved and specific areas of involvement
BiH	No	
Croatia	Yes	<ul style="list-style-type: none"> <li>• Croatian Veterinary Institute               <ul style="list-style-type: none"> <li>▪ Specific and nonspecific immunoprophylaxys in sea bass; leader: Dražen Oraić, DVM, PhD</li> <li>▪ Improvement of mollusc cultivation on the family owned farms; leader: Dražen Oraić, DVM, PhD</li> <li>▪ Improvement of mollusc cultivation and prevention of contamination of molluscs on the family owned farms; leader: Dražen Oraić, DVM, PhD</li> <li>▪ International project “Management of freshwater fisheries on bordering rivers – pilot study with holistic regional approach”2002. ## **SECTION 11. TRAINING**

### **Summary of results**

Survey results summarizing existence of formal training programmes in aquatic animal health in participating countries are presented in Table 11 (Questionnaire Parts 11.1–11.4). The results indicate that postgraduate-level training [(Master of Science (M.Sc.), Doctor of Philosophy (Ph.D)] is available to some extent in all countries but Montenegro. Limited formal non-degree training in aquatic animal health is also available in all countries.

### **Analysis**

There is presently limited opportunity for advanced training in aquatic animal health within the region. Consideration of training needs is a key component of a national aquatic animal health strategy. Postgraduate training is probably best accomplished by programmes for national staff in universities having internationally recognized programmes and expertise in aquatic animal health.

Short term training is organized by the national veterinary services and as a component of international projects. Specific needs should be identified, appropriate training mechanisms identified, and funding sought.

**Table 11. Summary of current status of training that supports aquatic animal health (AAH) in participating countries (Survey Questionnaire Parts 11.1–11.4).**

<b>Country</b>	<b>(11.1) Post-graduate training (M.Sc./Ph.D.)</b>	<b>(11.2) If Yes, Description of programmes, contact details, no. of staff and students involved, and areas of involvement</b>	<b>(11.3) Formal non-degree training</b>	<b>(11.4) If Yes, description of programmes, contact details, No. of staff and students involved, and areas of involvement</b>

Serbia	Yes	<p>Training related to aquaculture has been negligible.</p>	No

## **SECTION 12. EXPERTISE**

### **Summary of results**

A summary of results obtained by the Survey Questionnaire (Section 12) with regard to the numbers of individuals actively employed in areas of direct relevance to aquatic animal health in participating countries is presented in Table 12. All countries have advanced degree (Ph.D. or M.Sc.) holders as follows – BiH: unavailable; Croatia: total of 17 staff with Ph.D. and 3 DVM; The former Yugoslav Republic of The former Yugoslav Republic of Macedonia: 1 Ph.D. and 1 M.Sc.; Montenegro: 1 Ph.D., 1 M.Sc. and 1 DVM; and Serbia 6 Ph.D., 3 M.Sc. and 6 DVM.

### **Analysis**

An important consideration is assessing “available” expertise (i.e. the number of experts who are actually spending a significant amount of their time in conducting research, laboratory diagnostics or field studies related to aquatic animal health. Expertise that is primarily occupied with administration and management, while valuable for policy setting and planning, often does not contribute significantly to implementation of aquatic animal health programmes. Countries will need to access existing expertise to determine if it is adequate and appropriately utilized.

**Table 12. Summary of estimated number of individuals with tertiary qualifications in fields related to aquatic animal health in participating countries (only individuals actively employed in a capacity with direct relevance to the field of expertise are listed) (Survey Questionnaire Section 12).**

Country	Doctorate degree (by area of expertise)	Masters degree (by area of expertise)	Veterinary degree, bachelors degree, other degree
BiH <sup>1</sup>	NR	NR	NR
Croatia <sup>2</sup>	Parasitology (experimental) 4		3 DVM
	Virology 2		
	Bacteriology 2		
	Mycology 2		
	Epidemiology 3		
	Histopathology 2

	Subtotals 6		

<sup>1</sup>Although BiH indicated the presence of 158 doctoral, 168 masters, 2 079 DVM and 59 other (veterinary specialists) advanced degree holders, information as to how many of these personnel are actually working in disciplines related to aquatic animal health was unavailable.

<sup>2</sup>Data collected from Veterinary University, Croatian Veterinary Institute Zagreb and Veterinary Directorate.

## **SECTION 13. INFRASTRUCTURE**

### **Summary of results**

Survey results on current infrastructure (laboratories, office space, and other) dedicated solely to aquatic animal health activities or shared with other groups are summarized in Table 13 (Survey Questionnaire Parts 13.1–13.2). All respondents indicated the existence of infrastructure dedicated for aquatic animal disease diagnosis, as well as more general diagnostic facilities that could be shared with other subsectors.

### **Analysis**

Based on the available information, it appears that while all countries have some dedicated facilities, there is a general requirement to strengthen infrastructure in specific areas of need. Countries should consider current and future infrastructure needs when developing aquatic animal health strategies. The possibility of shared facilities should be considered.

**Table 13. Summary of infrastructure dedicated to aquatic animal health in participating countries (Survey Questionnaire Parts 13.1–13.2)**

Country	(13.1) Infrastructure dedicated solely to aquatic animal health			(13.2) Infrastructure available for aquatic animal health activities but shared with other groups		
	(a) Laboratories (type)	(b) Office space	(c) Other	(a) Laboratories (type)	(b) Office space	(c) Other
BiH	1			2		
Croatia	1 National Reference Laboratory	Zagreb		4 official laboratories	1 in Split, 1 in Rijeka and 2 in Zagreb	
The former Yugoslav Republic of Macedonia	1 Laboratory for diagnosis of fish diseases	25 m <sup>2</sup>		Laboratories for bacteriology, mycology, virology, immunology, serology and parasitology	200 m <sup>2</sup>	
Montenegro	1 Laboratory for diagnosis of fish diseases (within DVL)			Diagnostic Veterinary Laboratory, Podgorica		
Serbia	Laboratory for bacteriology, virology, ELISA, Immunofluorescence	1		Institute of Meat Hygiene and Technology, Belgrade  Scientific Veterinary Institute, Belgrade (molecular diagnostics, histopathology, parasitology)	3	

## **SECTION 14. LINKAGES**

### **Summary of results**

A summary of current international and domestic linkages and cooperation related to aquatic animal health in participating countries is given in Table 14 (Survey Questionnaire parts 14.1–14.2). Most international and domestic linkages cited by respondents did not clearly relate to aquatic animal health, with the exception of the recent FAO TCP/BiH/3101 Project “Strengthening aquaculture health management in Bosnia and Herzegovina”.

### **Analysis**

Developing international regional and domestic linkages and cooperation is clearly an area that offers great potential to increase aquatic animal health capacity among participating countries. Cooperation in research and training is possible via international agencies such as the FAO and OIE, via bilateral assistance, and with foreign universities and experts.

There is a great potential for regional cooperation and networking in almost all areas of aquatic animal health. Examples include the development of standardized procedures for import and export of live aquatic animals, harmonization of legislation, shared communication structures (websites, newsletters), development of a regional aquatic animal health information system (pathogen database, regional disease diagnostic and extension manuals), linkage of experts, cooperative research programmes, development of regional strategy and policy, regional disease reporting, a regional emergency response system, regional reference laboratory, regional risk analysis case studies for specific commodities, coordinated training efforts, etc. Mutual areas of concern need to be identified and prioritized on a regional basis and mechanisms for funding identified.

Domestically, linkages between agencies, particularly those agencies responsible for fisheries and aquaculture, veterinary services, biosecurity and environmental/conservation issues, should be promoted to develop standardized procedures. Cooperation between government, universities and the private sector should also be explored.

**Table 14. Summary of current international and domestic linkages and cooperation related to aquatic animal health in participating countries (Survey Questionnaire Parts 14.1–14.2)**

Country	(14.1) International, regional and bilateral linkages, cooperation and joint projects		(14.2) Domestic linkages, projects and cooperation between government, universities and/or private sector

## **SECTION 15. FUNDING SUPPORT**

### **Summary of results**

Participating countries indicated that dedicated budgets for aquatic animal health were quite limited (however, note that support for aquatic animal health activities is typically incorporated within the overall budgets of veterinary services). In all cases, funding was considered to be inadequate to address current and future needs.

### **Analysis**

Additional funding support for aquatic animal health in the five participating countries is clearly needed. This is an important issue, as without adequate budget, little improvement in capacity can be achieved. Each country will have to address its specific funding needs.

**Table 15. Estimated total annual budget dedicated specifically to aquatic animal health (AAH) activities in participating countries (Survey Questionnaire Parts 15.1–15.3)**

Country	(15.1) Estimated total annual budget dedicated specifically to AAH activities				(15.2) Is Funding adequate for current and future needs?	(15.3) If No, % increase required over next 5 years
	(a) Regular programme support	(b) Special funding/ project support	(c) Foreign assisted project support	(d) Total support		
BiH	€25 000 (for viral fish diseases) + EUR50 000 (for residues, not exclusively for fish)		€250 000 FAO TCP 3101/BiH Project “Strengthening aquatic animal health capacities in Bosnia and Herzegovina”		No	Depending on global financial situation, amount should increase by least 30%.
Croatia	US\$88 565,81			US\$88 565,81	No	Yearly increase of 10-20 % planned; will follow the increase of production quantities.
The former Yugoslav Republic of Macedonia					No	
Montenegro	€2 700,00			€2 700,00	No	300%
Serbia	0	0	0	0	No	NA

## SECTION 16. CURRENT CHALLENGES AND CONSTRAINTS

### Summary of results

Respondents provided detailed information of the current challenges that their countries are facing in their efforts to improve aquatic animal health capacity and noted their major constraints (Tables 16A and 16B; Survey Questionnaire Parts 16.1 and 16.2).

Challenges related to preventing the entry and spread of exotic pathogens included the following:

- (1) the need for meeting OIE and national standards (Croatia and The former Yugoslav Republic of Macedonia);
- (2) improving risk analysis capacity (BiH, The former Yugoslav Republic of The former Yugoslav Republic of Macedonia, Montenegro);
- (3) improving disease monitoring (BiH);
- (4) improving diagnostics (Serbia); and
- (5) upgrading specific laboratory capacity (BiH, Montenegro).

Challenges related to preventing the domestic spread of serious pathogens included the following:

- (1) upgrading stakeholder knowledge (BiH, Montenegro);
- (2) developing contingency plans (BiH, Montenegro);
- (3) upgrading data collection and analysis (BiH, Montenegro);
- (4) implementing national surveillance and monitoring programmes (Croatia, The former Yugoslav Republic of Macedonia, Montenegro);
- (5) aligning with EU legislation (Montenegro); and
- (6) dealing with disrespect of current legislation (Serbia).

Challenges related to meeting international and trading-partner standards for health certification included the following:

- (1) improving diagnostic capacity and issuance of relevant legal documents (BiH);
- (2) meeting OIE and EU standards (Croatia, The former Yugoslav Republic of Macedonia);
- (3) drafting and adoption of EU-harmonized legislation (Montenegro);
- (4) dealing with other legislative constraints (Serbia); and
- (5) education (Montenegro and Serbia).

Challenges related to controlling mortalities and losses due to pathogens in aquaculture facilities included the following:

- (1) improving education (BiH, Montenegro);
- (2) improving communication (BiH, Montenegro);
- (3) documenting and recording on-farm mortalities (Croatia, The former Yugoslav Republic of The former Yugoslav Republic of Macedonia, Montenegro); and
- (4) obtaining prompt notification of mortalities from producers (Serbia).

Challenges related to the use of antibiotics and chemotherapeutants in aquaculture included the following:

- (1) improving capacity to inspect and control use (The former Yugoslav Republic of Macedonia, Montenegro and Serbia).

Other serious challenges likely to arise in the next five years included the following:

- (1) possibility of new diseases being introduced (Croatia, The former Yugoslav Republic of Macedonia, Serbia);
- (2) the need to constantly educate stakeholders, veterinary staff and laboratory staff (Montenegro);
- (3) legislative challenges (Montenegro); and
- (4) budgetary constrictions (Montenegro).

Major constraints to implementing effective aquatic animal health programmes included the following:

- (1) budgetary limitations (all countries);
- (2) educational constraints (all countries);
- (3) legislative issues (Montenegro, Serbia);
- (4) lack of risk analysis capacities and contingency plans (Croatia, The former Yugoslav Republic of Macedonia); and
- (5) lack of staff (Serbia).

### **Analysis**

The current challenges for improving aquatic animal health capacity in participating countries touched on almost all major areas of a national aquatic animal health strategy. These include the need for improved policy and planning, improved expertise in areas such as risk analysis and diagnostics, better surveillance, monitoring and control, improved legislation and better stakeholder consultation. These are all areas that should be given high priority in preparing a regional approach to improving aquatic animal health capacity.

Funding is noted as a current constraint and a future challenge by several countries, indicating that the case for improved capacity in aquatic animal health must be made more strongly to senior government managers.

**Table 16A. Summary of current challenges related to improving aquatic animal health (AAH) capacity in participating countries (Survey Questionnaire Part 16.1)**

Country	(16.1) Type of Challenge					
	(a) Preventing entry and spread of exotic pathogens	(b) Preventing domestic spread of serious pathogens	(c) Meeting International and trading partner standards for health certification	(d) Controlling mortalities/ losses due to pathogens in aquaculture	(e) Use of antibiotics/ chemo-therapeutants	(f) Other serious challenges likely in next 5 years
BiH	Developing adequate risk analysis resources for AA and monitoring programmes for KHV and ISA, with subsequent upgrading of laboratory capacities	Upgrading stakeholder knowledge on prevention and early detection of VHS, IHN and SVC; developing appropriate contingency plans; upgrading data collection and analysis.	Improving diagnostic capacities and issuing of relevant legal documents (including drafting of updated monitoring programmes)	Maintaining good quality of education and communication		

Croatia	Trade in accordance with OIE standards and national legislation	Implementation of national surveillance and monitoring programmes for AA diseases in accordance with legislation	Meeting OIE and EU standards	Documentation and records of mortality on farms	Usage is prescribed by Law on Veterinary Medicinal Products and official records must be kept as evidence on use of antibiotics and other chemotherapeutants for disease prevention and/or treatment	Possible introduction of new emergency AA diseases
The former Yugoslav Republic of Macedonia	Trade in accordance with OIE standards and national legislation; developing adequate resources for AA risk analysis	Implementation of national programmes for surveillance and monitoring of AA diseases made in accordance with legislation <sup>1</sup>	Meeting OIE and EU standards	Documentation and records of mortality on farms	Usage is prescribed by Law on Veterinary Medicinal Products and official records must be kept as evidence on use of antibiotics and other chemotherapeutants for disease prevention and/or treatment	Possible introduction of new emergency AA diseases

<sup>1</sup> Relevant legislation includes the rulebook for diseases compulsorily notifiable to the CA, which is in draft version and is according to the OIE's *Aquatic Animal Health Code*; and EU legislation: Council Directive 82/894/EEC of 21 December 1982 on the notification of animal diseases within the Community; 2008/755/EC: Commission Decision of 24 September 2008 amending Decision 2005/176/EC laying down the codified form and the codes for the notification of animal diseases pursuant to Council Directive 82/894/EEC; and Council Directive 2006/88/EC of 24 October 2006 on animal health requirements for aquaculture animals and products thereof, and on the prevention and control of certain diseases in aquatic animals.

Montenegro	Development of adequate risk analysis resources for aquatic animals; upgrading of laboratory capacities	Alignment with EU aquatic animal health legislation and implementation of national programmes for surveillance and monitoring of aquatic animal diseases in accordance with legislation; determining national disease status; upgrading stakeholder knowledge on prevention and early detection of aquatic diseases; developing appropriate contingency plans; upgrading data collection and analysis.	Preparation and adoption of the EU legislation on trade of aquaculture animals; education	Education; improvement of communication; documentation and records for farm mortalities	Training on inspection control, education	Constant education of stakeholders, veterinary administration and laboratory staff; legislative
Serbia	Prompt diagnosis	Disrespect of current legislation	Legislation mostly outdated or lacking, not harmonized with EU; official controls and monitoring system must be regulated in a way acceptable to EU; educational constraints	Obtaining prompt notification from producers	Inadequate inspection control, education	Budget constrictions, import of new diseases

**Table 16B. Summary of the major constraints to implementing an effective aquatic animal health programme, in order of importance, as identified by the respondents (Survey Questionnaire Part 16.2)**

Country	(17.1) Major constraints
BiH	<ul style="list-style-type: none"> <li>• Limited financial resources</li> <li>• Need for constant education of all stakeholders</li> </ul>
Croatia	<ul style="list-style-type: none"> <li>• Limited financial resources</li> <li>• Need for education of stakeholders</li> <li>• Lack of risk analysis</li> <li>• Lack of contingency plans</li> </ul>
The former Yugoslav Republic of Macedonia	<ul style="list-style-type: none"> <li>• Limited financial resources</li> <li>• Need for constant education of all stakeholders</li> <li>• Lack of contingency plans</li> <li>• Lack of risk analysis capacities</li> </ul>
Montenegro	<ul style="list-style-type: none"> <li>• Lack of financial resources</li> <li>• Constant education of stakeholders, veterinary administration and laboratory staff</li> <li>• Legislative constraints</li> </ul>
Serbia	<ul style="list-style-type: none"> <li>• Limited funding support</li> <li>• Legislative constraints</li> <li>• Understaffing</li> <li>• Education</li> </ul>

## ADDITIONAL INFORMATION ON AQUACULTURE TRENDS, RESOURCES AND DATA

Respondents from four countries provided supplementary information on national aquaculture development and trends as follows:

### Bosnia and Herzegovina

#### *Length and tradition of aquaculture*

The earliest records of organized fish production date back to 1892. After the Second World War, this production sector expanded rapidly in response to increasing demands by a steadily growing urban population. Before the 1992–1995 war, BiH had a well-developed aquaculture sector, especially production of salmonid fish (rainbow trout, brown trout and brook char), whereas cyprinids (common carp, grass carp and silver carp) were cultured to a lesser extent. During the 1992–1995 war, most of the production facilities were destroyed. The process for renewal of the aquaculture sector started immediately after the war, and by the year 2000 the first modern fish processing companies were established. The abundant water resources of BiH provide ideal conditions for further development of aquaculture and fisheries through the installation of hatcheries and grow-out facilities on suitable rivers and floating cages in lakes and in the Bosnian part of the Adriatic Sea. Furthermore, existing resources also provide excellent conditions for sport fishing and fishing-based tourism.

#### *Production systems and species*

The most important species are:

- salmonids (rainbow trout, brown trout, brook char)
  - cyprinids (common carp, grass carp, silver carp)
  - catfish
  - marine species (European seabass, gilthead seabream, dentex)
- Salmonid fish farms are mainly made from concrete with optimal flows and high quality waters. Aeration has not been used. As well, after the war there was a great expansion of cage fish farming. Today cages of 10 x 10 x 10 m are used.
  - Cyprinid fish farms have been made from soil and have a long tradition in production. In Bosnia and Herzegovina, there is no hatchery for cyprinid species.
  - Marine aquaculture is represented by only two fish farms (cages) in Neum in the Adriatic Sea. Although mariculture does not make a significant contribution to overall aquaculture production in BiH, since 1999 production of marine species has increased.
  - *Number and sizes of aquaculture farms:* 31 salmonid fish farms, 6 cyprinid fish farms and 2 marine fish farms
  - *Processing plants for aquaculture products:* 4

### Croatia

#### *Production systems and species*

Aquaculture species:

- carp (*Cyprinus carpio*)
- grass carp (*Ctenopharyngodon idella*)
- rainbow trout (*Oncorhynchus mykiss*)
- seabass (*Dicentrarchus labrax*)
- seabream (*Sparus aurata*)
- blufin tuna (*Thunnus thynnus*)
- blue mussel (*Mytilus galloprovincialis*)
- European flat oyster (*Ostrea edulis*)

In the Republic of Croatia, 116 establishments for fish products have been approved. Out of that number, 61 facilities have been given permission for export to the EU.

#### Fish farms

- freshwater fish	35
- sea fish	36
- tuna	8

#### LBM production areas

- 17 production areas
  - 14 production areas in which bivalve molluscs are being cultivated
  - 3 production areas from which bivalve molluscs are being harvested
- 4 preliminary production areas
  - 2 preliminary production areas in which bivalve molluscs are being cultivated
  - 2 preliminary production areas from which bivalve molluscs are being harvested

### **The former Yugoslav Republic of Macedonia**

#### *Length and tradition of aquaculture*

The former Yugoslav Republic of Macedonia does not have open sea and the water resources generally consist of lakes, rivers and artificial accumulations, including aquaculture establishments for farming. Aquaculture is more than 100 years old (e.g. traditional way of hunting with cormorants in Dojran lakes), although, organized production with respect to managing aquatic biosecurity has occurred within the past 20 years. The former Yugoslav Republic of Macedonia had a well-developed aquaculture sector, especially for production of salmonids (rainbow trout, brown trout), whereas cyprinids (common carp, grass carp and silver carp) and catfish are cultured to a lesser extent. The abundant water resources provide ideal conditions for further development of aquaculture and fisheries through the installation of hatcheries and grow-out facilities on suitable rivers and the use of floating cages in artificial accumulations or lakes. Furthermore, existing resources also provide excellent conditions for sport fishing and fishing-based tourism.

#### *Production systems and species*

- salmonids: rainbow trout, brown trout
- cyprinids: common carp, grass carp, silver carp
- catfish
- Ohrid trout (*Salmo letnica*) and carp (*Rutilus rutilus dojranensis*) are reared only in Ohrid and Dojran lakes as endemic species.
  - *Total production, based on latest available statistics, with a breakdown by main species and by regions: 62 fish farms, providing an annual production of 992 000 kg of salmonids and cyprinids in 2008 (production in years 2007 and 2006 was 771 000 kg and 958 000 kg, respectively).*

### **Montenegro**

#### *Length and tradition of aquaculture*

- Trout farming started during the 1950s; seabream, seabass and mussel farming within the last 20 years.

#### *Production systems and species*

- trout (cage system and race ways)
- seabream and seabass (cage system)

- mussels (long-line)
- *Total production, based on latest available statistics, with a breakdown by main species and by regions:*
  - trout: 450 tonnes
  - seabream and seabass: 130 tonnes (2008, Ministry of Agriculture)
  - mussels: 200 tonnes (2008, Ministry of Agriculture)
- *Breakdown of production (e.g., for consumption, export, stocking, etc.):*
  - trout – export 20 tonnes; consumption – no data, stocking – no data
  - mussels – export 20 tonnes, consumption 180 tonnes
- *Number and sizes of aquaculture farms:*
  - 24 trout farms, most between 5–20 tonnes; 4 large (50–120 tonnes)
  - 2 seabream/seabass cage systems
  - 16 mussel farms (10–50 tonnes)
- *Processing plants for aquaculture products:* None

## Serbia

### *Production systems and species*

- *Total production, based on latest available statistics, with a breakdown by main species.*

<b>Common name</b>	<b>Scientific name</b>	<b>2006, kg</b>	<b>2007, kg</b>	<b>2008, kg</b>
Carp	<i>Cyprinus carpio</i>	4 309 311	5 517 826	5 760 469

Rainbow Trout	<i>Oncorhynchus mykiss</i>	607 795	641 947	1 051 966

- *Breakdown of production (e.g., for consumption, export, stocking, etc.):* mainly for domestic consumption
- *Number and sizes of aquaculture farms:* 16 registered fish farms with export control number
- *Processing plants for aquaculture products:* 6 registered processing plants with export control number

## Questionnaire Survey Form

### Western Balkans Regional Aquatic Animal Health Capacity and Performance Survey

#### Background

This regional survey of aquatic animal health capacity and performance was recommended by the recent Western Balkan Regional Seminar on Aquatic Animal Health, an activity under the FAO/TCP/3101/BiH “Strengthening Capacity on Aquaculture Health Management in Bosnia and Herzegovina” held from 19–22 May 2008 in Sarajevo and is strongly supported by representatives of the following participating countries (Bosnia and Herzegovina, Croatia, The former Yugoslav Republic of Macedonia, Montenegro and Serbia). It is one of a series of activities being conducted under a TCP Facility from the FAO entitled “Assistance to Western Balkans Countries for Improving Compliance with International Standards for Aquatic Animal Health,” an initiative that is expected to lead to the development of a proposal for an FAO Regional TCP Project “Western Balkans Regional Aquatic Animal Health Strategy Development”.

The regional survey will provide background information for assessment of the current status and future needs in aquatic animal health capacity and expertise of countries in the Western Balkans Region that will assist in formulating a proposal for an FAO Regional TCP Project. The activities being conducted under the TCP Facility support include: (i) assessment of institutional and human resource capacities on aquatic animal health at national level through a questionnaire survey, (ii) follow-up field visits to verify survey results and collect additional key data, (iii) preparation of a proposal for a Regional TCP Project and (iv) organization of a regional workshop to present the results of the survey, and further develop and achieve consensus on the regional TCP project proposal.

The seven countries comprising the Western Balkans (Albania and the newly independent nations of the former Yugoslavia – Bosnia and Herzegovina, Croatia, The former Yugoslav Republic of Macedonia, Montenegro, Serbia and Slovenia) have a long history of aquaculture. These countries are in the process of developing modern aquaculture production systems as a means of providing healthy low-cost protein to their citizens and generating export earnings. The region has an advantageous situation with regard to aquaculture development, having large areas of high-quality fresh waters, skilled and relatively inexpensive labour, and proximity to large markets in the European Union (EU).

To realize this potential, Western Balkan countries are attempting to develop the capacity to meet international standards for trade in live aquatic animals (fish, crustaceans and molluscs) and their products. Primary among these are the standards of the World Organisation for Animal Health (formerly the Office International des Epizooties, OIE) as expressed in the OIE *Aquatic Animal Health Code* and *the Manual for Diagnosis of Aquatic Animal Diseases*, the Sanitary and Phytosanitary Agreement (SPS Agreement) of the World Trade Organization (WTO), and the standards for market access as required by the European Union, as expressed in various EU Directives. Achieving these goals requires meeting high standards for aquaculture production, including a high level of capacity to address issues related to the control and prevention of aquatic animal diseases.

## **Purpose**

The purpose of this survey is to obtain information on national capacity and the agencies mandated to implement aquatic animal health programmes for five Western Balkans regional countries (Bosnia and Herzegovina, Croatia, The former Yugoslav Republic of Macedonia, Montenegro and Serbia). The survey also collects relevant information essential to support the development of the aquaculture sector through healthy aquatic production and seeks opinions on the components and activities that might be included in a regional aquatic animal health strategy. The results of this survey will help guide regional and national strategic planning for improving aquatic animal health and assuring adequate and rational support services to achieve sustainable aquaculture development. The survey questionnaire contains 18 sections pertaining to: (1) international trade in live aquatic animals and national border controls, (2) control of domestic movement of live aquatic animals and other domestic activities that may spread pathogens, (3) policy and planning, (4) legislation, (5) disease surveillance/monitoring, (6) disease diagnostics, (7) emergency preparedness and contingency planning, (8) extension services, (9) compliance/enforcement, (10) research, (11) training, (12) expertise, (13) infrastructure, (14) linkages and cooperation, (15) funding support, (16) current challenges and constraints and (17) additional information.

## **Participation**

Five Western Balkan countries (Bosnia and Herzegovina, Croatia, The former Yugoslav Republic of Macedonia, Montenegro and Serbia) will participate in the survey.

## **Process**

The survey questionnaires, jointly developed by FAO FIRA(M. Reantaso) and the International Consultant (J.R. Arthur) in collaboration with the National Consultants (S. Tanković, N. Fejzić), will be conducted between mid-May and end of August 2009.

This survey should be completed by the national competent authority or other senior government officer with primary responsibility for national aquatic animal health issues, with the assistance of national aquaculture experts and concerned laboratory personnel. FAO will summarize and analyze the survey results and incorporate the outcomes of the field visits that will be undertaken between May and August 2009. The survey results and associated field survey data will be used to prepare a draft proposal for an FAO Regional TCP Proposal: *Assistance to Western Balkan Countries for Improving Compliance to International Standards on Aquatic Animal Health*. The results of the survey and the draft project proposal will be presented to participants at the FAO TCP/RER/3206 Regional Proposal Development Workshop “Assistance to Western Balkan Countries for Improving Compliance with International Standards for Aquatic Animal Health”, to be held in Zagreb, Croatia in early September 2009.

## **Product**

A summary and critical analysis of the survey results will be prepared and will form the basis for the development of draft Regional TCP Proposal that will be presented, discussed, revised and endorsed during the regional workshop.

**Description of Competent Authorities on various aspects of aquatic animal health responsibilities**

<b>Responsibility</b>	<b>Agency/Ministry</b>	<b>Mandate/Authority</b>
Aquatic animal health with regard to export and import matters		
Development of biosecurity policies, for example conduct of risk analysis, negotiation of export protocols for animal health and for assessing foreign Competent Authorities		
Control of aquatic animal diseases and pharmaceutical product residues		
Inspection, surveillance and reporting

**SECTION 1. International trade in live aquatic animals and national border controls**

- 1.1 Is your country a member of the **World Organisation for Animal Health** (OIE, Office International des Epizooties)?
- Yes  No
- 1.2 If **yes**, please indicate the government agency/person that is recognized by the OIE as your country's competent authority for purposes of reporting aquatic animal health's status ? (If the Chief Veterinary Officer, please indicate):
- 1.3 Is your country a member of the **World Trade Organization** (WTO)?
- Yes  No
- 1.4 Is your country a member of the European Union or currently in the process of applying for EU membership?
- EU Member  candidate country  potential candidate
- 1.5 If in process of application for EU membership, please briefly summarize status of application.
- 1.6 If your country is currently a non-EU member, does it have approval to export aquatic animal commodities to the European Union?
- has approval  seeking approval  not seeking approval
- 1.7 If seeking approval, please briefly summarize status of application.
- 1.8 Does your country have **legislation** that supports or strengthens government control of imports and exports with respect to aquatic animal health?
- Yes  No
- 1.9 If **yes**, name and briefly describe all legislation and where applicable, indicate which specific EU directives or decisions the legislation conforms to (e.g. EU Directive 8/2006 which replaced 91/67/EEC, 93/53/EEC and 95/70/EEC) and others listed in Annex 1:
- 1.10 Does your country export live **aquatic animals** to other countries?
- Yes  No

- 1.11 If **yes**, please briefly list the principal species exported, their life cycle stage(s), the destination country(ies), volumes (please indicate clearly as e.g. kgs, number of live animals, etc.), estimated values (please indicate in US\$) and the time period. Please provide separate information for commercial aquaculture and the ornamental fish trade. You can use a table like the one below:

Species (life cycle stage)	Country of destination	Volume ( Units )	Value ( US\$ )	Date Covered

- 1.12 If **yes**, please describe any associated aquatic animal health certification that you provide to the importing country, including the name and contact details of the government agency/ies that provides this certification:

- 1.13 If **yes**, is certification done:

- (a) for **freedom from specified pathogens** using the methods outlined in the OIE aquatic animal disease diagnostics manual ([http://www.oie.int/eng/normes/en\\_amanual.htm?e1d10](http://www.oie.int/eng/normes/en_amanual.htm?e1d10)):

Yes  No

- (b) to whatever **standards the importing country requires**:

Yes  No

- (c) to other standards based on general appearance of health (e.g. by visual inspection) or using testing protocols devised by agencies within your country

Yes  No

- 1.14 Are live aquatic animals **imported** to your country from other countries?

Yes  No

- 1.15 If **yes**, please briefly list the principal species imported, their life cycle stage(s), the countries of origin, volumes (please indicate clearly as e.g. kgs., number of live animals, etc.), and estimated values (please indicate in US\$). Please provide separate information for commercial aquaculture and the ornamental fish trade. You can use a table like the one below:

Species (life cycle stage)	Country of origin	Volume ( Units )	Value ( US\$ )	Date covered

- 1.16 If **yes**, describe any associated aquatic animal health certification that you require to be provided by the exporting country.
- 1.17 If **yes**, describe any other official controls or risk management measures to which imported aquatic animals or aquatic animal products are subject (e.g. veterinary inspection at the port of entry, quarantine, or end-use controls such as prohibitions on the release of live aquatic animals into natural waters):
- 1.18 Is there expertise in your country for **Import Risk Analysis** (IRA) for aquatic animal pathogens?
- ( ) Yes ( ) No
- 1.19 If **yes**, provide contact details of the agency/ies with this expertise and provide examples (and where applicable, citations for published documents) of the import risk analyses that have been undertaken:
- 1.20 Is evaluation of risks for aquatic animal **pathogens linked with evaluation of other risks** (e.g. ecological, pest, invasive alien species, genetic risks, food safety)?
- ( ) Yes ( ) No
- 1.21 If **yes**, briefly describe how is this accomplished (e.g. by interagency committee)

**SECTION 2. Control of domestic movements of live aquatic animals and other domestic activities that may spread pathogens**

2.1 Does your country have any **regulations controlling the in-country movement** of live aquatic organisms?

( ) Yes ( ) No

2.2 If **yes**, briefly describe these controls, including the name and contact details of the responsible agency/ies and the legislation that provides authority for this control:

2.3 Does your country have any regulations **pertaining waste disposal from inland/seafood processing** plants in relation to preventing the spread of aquatic animal pathogens?

( ) Yes ( ) No

2.4 If **yes**, briefly describe these controls, including the name and contact details of the responsible agency/ies and the legislation that provides authority for this control:

**SECTION 3. Policy and planning**

3.1 Has an agency or agencies been designated as responsible for national aquatic animal health policy and planning for your country?

( ) Yes ( ) No

3.2. If **yes**, indicate agency(ies) or department(s) and please indicate their responsibilities.

( ) Yes ( ) No

3.3 Has official policy been expressed in a **National Aquatic Animal Health Plan**, strategy, legislation or other document?

( ) Yes ( ) No

3.4 If **yes**, provide citation for document:

3.5 If **no**, briefly describe how issues impacting national aquatic animal health are currently being handled:

3.6 Do **subnational entities** (state, provincial, local government, private sector) play a role in setting national aquatic animal health policy?

( ) Yes ( ) No

3.7. If **yes**, briefly describe their role(s):

3.8 Is current policy for aquatic animal health:

(a) **adequate for preventing the entry and spread** of exotic aquatic animal pathogens?

Yes  No

(b) **adequate for controlling serious diseases** within country?

Yes  No

(c) **effectively implemented**?

Yes  No

3.9 Which of the following areas are **addressed in national policy**?

national diagnostics services:	<input type="checkbox"/> Yes	<input type="checkbox"/> No
risk analysis:	<input type="checkbox"/> Yes	<input type="checkbox"/> No
farm-level treatment and prevention:	<input type="checkbox"/> Yes	<input type="checkbox"/> No
emergency preparedness and disease control:	<input type="checkbox"/> Yes	<input type="checkbox"/> No
manpower requirements:	<input type="checkbox"/> Yes	<input type="checkbox"/> No
training requirements:	<input type="checkbox"/> Yes	<input type="checkbox"/> No
infrastructural requirements:	<input type="checkbox"/> Yes	<input type="checkbox"/> No
financial requirements and planning:	<input type="checkbox"/> Yes	<input type="checkbox"/> No
international treaties, memberships and linkages:	<input type="checkbox"/> Yes	<input type="checkbox"/> No
communication (interagency, stakeholder):	<input type="checkbox"/> Yes	<input type="checkbox"/> No

3.10 What are the **current priorities for your country** with regard to national aquatic animal health policy (list in order of importance)?

#### **SECTION 4. Legislation**

4.1 Is there **specific legislation** in place dealing with aquatic animal health?

Yes  No

4.2. Please, give a name of legislation related with aquatic animal health if such legislation/sublegislation exist as separate act.

4.3 If **yes**, indicate if aquatic animal health legislation is:

By separate act or regulation:  Yes  No

As part of broader veterinary, aquaculture, environmental protection or conservation legislation or regulation:  Yes  No

- 6.4 If **yes**, please provide contact information:
- 6.5 Are any laboratories in your country accredited as **international or national reference centers** for aquatic animal disease diagnosis?  
 Yes  No
- 6.6 If **yes**, please indicate laboratory(ies), accrediting body and type of accreditation:
- 6.7 Does your country's government and private aquaculture sector have access to other public or private-sector laboratory-based disease diagnostic services?  
 Yes  No
- 6.8 If **yes**, briefly describe this service/s, including the name and contact details of the responsible institutes/companies and the range of services available, including:
- Parasitology
  - Histopathology
  - General bacteriology/mycology
  - General virology
  - Electron microscopy
  - Tissue culture
  - Molecular diagnostics (e.g. PCR)
  - Immunoassay (e.g. ELISA)
  - Water quality analysis
  - Chemotherapy
  - Health certification
  - Facility inspection
  - Other services??
- 6.9 Is there a **national pathogen list** for aquatic animal diseases?  
 Yes  No
- 6.10 If **yes**, list the criteria for inclusion of a pathogen in the national list and give those aquatic animal diseases/pathogens that are listed:

### **SECTION 7. Emergency preparedness/contingency planning**

- 7.1 Does your country have any **contingency or emergency response plans** for containment or eradication of serious aquatic animal diseases?  
 Yes  No

- 7.2 If **yes**, briefly describe these plans, including the name and contact details of the responsible agency/ies and any legislation that supports emergency response activity:
- 7.3 If **no**, briefly describe any emergency response plans for terrestrial animal diseases or terrestrial plant pests or invasive pest species in your country, including the name and contact details of the responsible agency/ies and any legislation that supports emergency response activity:

### **SECTION 8. Extension services**

- 8.1 Does your country have any **extension services** that support the prevention of aquatic animal diseases in aquaculture?
- ( ) Yes ( ) No
- 8.2 If **yes**, briefly describe this service, including the name and contact details of the responsible agency/ies, the number of staff involved and specific areas of involvement:
- 8.3. If **no**, indicate what agency, if any, is mandated to fulfill this function and provide contact details:

### **SECTION 9. Compliance/enforcement**

- 9.1 Does your country have any compliance services that monitors and enforces:
- (a) **international trade in live aquatic animals** (importations and exports), including aquatic animal health regulations?
- ( ) Yes ( ) No
- 9.2 If **yes**, briefly describe this service, including the name and contact details of the responsible agency/ies, the number of staff involved and the legislation that supports compliance activity:
- 9.3 Does your country have any compliance services that monitors and enforces:
- (b) **domestic movements** of live aquatic animals, including aquatic animal health regulations?
- ( ) Yes ( ) No
- 9.4 If **yes**, briefly describe this service, including the name and contact details of the responsible agency/ies, the number of staff involved and the legislation that supports compliance activity:

9.5 Does your country have any compliance services that monitors and enforces:

(c) **regulations related to disease prevention**, management and control in aquaculture facilities?

( ) Yes ( ) No

9.6 If **yes**, briefly describe this service, including the name and contact details of the responsible agency/ies, the number of staff involved and the legislation that supports compliance activity:

### **SECTION 10. Research**

10.1 Does your country have **any research activity** that includes aquatic animal health in its scope?

( ) Yes ( ) No

10.2 If **yes**, briefly describe this research, including the name and contact details of the responsible institute/s, the number of staff and students involved and specific areas of involvement:

### **SECTION 11. Training**

11.1 Does your country have any formal **post-graduate training** programmes (M.Sc. or Ph.D.) in areas related to aquatic animal health?

( ) Yes ( ) No

11.2 If **yes**, briefly describe these programmes, including the name and contact details of the responsible institute/s, the number of staff and students involved and specific areas of involvement:

11.3 Does your country have any **formal non-degree training** programmes (short courses, work-study programmes etc.) in areas related to aquatic animal health?

( ) Yes ( ) No

11.4 If **yes**, briefly describe these programmes, including the name and contact details of the responsible institute/s, the number of staff and students involved and specific areas of involvement:

**SECTION 12. Expertise**

Summarize the estimated total numbers of individuals in the country with particular levels of tertiary qualifications in each of the stated fields related to aquatic animal health – only those actively employed in a capacity with direct relevance to the field of expertise should be included:

Field of Expertise in Aquatic Animal Health	Level of Qualification				
	Doctorate	Masters degree	Veterinary degree	Bachelors degree	Other (specify)
Parasitology (experimental)					
Parasitology (taxonomy/systematics)					
Virology					
Bacteriology					
Mycology					
Epidemiology					
Histopathology					
Toxicology/water quality					
Molecular diagnostics (e.g. PCR, ELISA)					
Electron microscopy					
Aquatic biosecurity (e.g. risk analysis)					
Fish medicine/Pharmacology					
Aquatic animal health information systems					
Other (specify): physiology					

**SECTION 13. Infrastructure**

13.1 Summarize the available **infrastructure dedicated solely to aquatic animal health**:

- (a) Laboratories (type):
- (b) Office space :
- (c) Other: (e.g., aquaculture ponds, tank rooms) :

13.2 Summarize the available infrastructure available for aquatic animal health activities but **shared with other groups**:

- (a) Laboratories (type):
- (b) Office space:
- (c) Other: (e.g., aquaculture ponds, tank rooms, electron microscope etc.)

- (e) use of antibiotics and other chemotherapeutants for disease prevention and/or disease treatment:
- (f) any other serious challenges related to aquatic animal health that your country is facing or is likely to face in the next 5 years:

16.2 List the **major constraints** to implementing an effective aquatic animal health programme for your country, in order of importance:

### **SECTION 17. Additional information**

17.1 Provide any additional information about your country's capacities or capabilities with respect to managing aquatic biosecurity that is not mentioned in the responses to the above questions :

17.2 Provide additional information on **aquaculture trends, resources and production data**:

- length and tradition of aquaculture;
- production systems and species;
- total production, based on latest available statistics, with a breakdown by main species and by regions;
- breakdown of production (e.g., for consumption, export, stocking, etc.);
- water resources used for aquaculture (resource availability by water type – fresh, coastal/brackish, etc.; area utilised/unutilised; production areas used for finfish, molluscs, crustaceans);
- number and sizes of aquaculture farms;
- processing plants for aquaculture products.

**List of persons completing the survey questionnaire**

**BOSNIA AND HERZEGOVINA**

### Identification of competent authorities for various aspects of aquatic animal health

#### BOSNIA AND HERZEGOVINA

Aquatic animal health activity	Officially mandated agency	Mandate/authority
Development of policy and legislation for AA biosecurity (e.g. national strategic planning and programme development, decisions on risk analyses, emergency preparedness, planning, negotiation of export protocols, etc.)	Veterinary Office of BiH in collaboration with the entity competent authorities (see section 3, point 3.2.)	See section 3, point 3.2.
Implementation of national/state AAH policy and regulations with regard to export and import of AA commodities (border inspection, quarantine, assessment of foreign Competent Authorities, etc.)	<ol style="list-style-type: none"> <li>1. Veterinary Office of BiH</li> <li>2. Entity Ministries of Agriculture (including BD)</li> <li>3. Entity Veterinary Inspectorates (including BD)</li> <li>4. Cantonal Veterinary Inspection</li> <li>5. Municipality Veterinary Inspection</li> </ol>	<ol style="list-style-type: none"> <li>1. Border veterinary inspection</li> <li>2. Enforcement of national legislation</li> <li>3. Enforcement of national legislation</li> <li>4. Enforcement of national legislation</li> <li>5. Enforcement of national legislation</li> </ol>
Enactment of AAH legislation, regulations, orders, directives, etc. Conduct of risk analyses for aquatic animal commodities Monitoring, surveillance and reporting of aquatic animal diseases	<ol style="list-style-type: none"> <li>1. Veterinary Office of BiH</li> <li>2. Entity Ministries of Agriculture (including BD)</li> <li>3. Entity Veterinary Inspectorates (including BD)</li> <li>4. National Reference Laboratory</li> </ol>	See section 3, point 3.2.
Implementation of national/state emergency response plans	<ol style="list-style-type: none"> <li>1. Veterinary Office of BiH</li> <li>2. Entity Ministries of Agriculture (including BD)</li> <li>3. Veterinary Inspection from all levels (including BD)</li> <li>4. Laboratories</li> <li>5. Veterinary organizations</li> </ol>	See section 3, point 3.2.
Monitoring and control of pharmaceutical residues in cultured and wild AA	<ol style="list-style-type: none"> <li>1. Veterinary Office of BiH</li> <li>2. Entity Ministries of Agriculture (including BD)</li> <li>3. Veterinary Inspection from all levels (including BD)</li> </ol>	See section 3, point 3.2.
Internationally/nationally accredited laboratories for diagnosis of OIE-listed AA diseases (and other serious diseases)		
Issuance of International Health Certificates	<ol style="list-style-type: none"> <li>1. Veterinary Office of BIH</li> <li>2. Entity Veterinary Inspection from all levels</li> </ol>	See section 1, point 1.12.

	(including BD)

## APPENDIX V

### **Draft regional Technical Cooperation Programme (TCP) proposal: Assistance to Western Balkan Countries for improving compliance to international standards on aquatic animal health**

#### **BACKGROUND AND JUSTIFICATION**

This regional TCP Proposal “Assistance to Western Balkan Countries for Improving Compliance to International Standards on Aquatic Animal Health” is the result of a lengthy consultative and consensus-building process among countries of the Western Balkan Region (Bosnia and Herzegovina (BiH), Croatia, The former Yugoslav Republic of Macedonia, Montenegro and Serbia) that was initiated under the TCP/BiH/3101 project “Strengthening Capacity on Aquaculture Health Management in Bosnia and Herzegovina”. Project TCP/BiH/3101 was officially approved on 14 June 2006 with the development objective of increasing the effectiveness and efficiency of the State Veterinary Office (SVO) of BiH in aquatic animal health management. This objective supports sustainable and healthy aquaculture production, enabling the country to improve the value and efficiency of aquaculture production through the implementation of international animal health and food safety standards, especially those of its trading partners in Europe and neighboring countries.

One of the specific objectives of the project was to disseminate the project outcomes to neighboring trading partners in order to promote future cooperation in aquaculture and aquatic animal health management in the region. As part of the above TCP, the FAO Western Balkan Regional Seminar/Workshop on Aquatic Animal Health was undertaken from 19 to 21 May 2008 in Sarajevo, BiH. Among the goals of the regional workshop were to “(iii) identify opportunities for seeking solutions to common problems related to pathogen issues affecting regional trade between Balkan States and key European Union trading partners; and (iv) discuss and possibly formulate a programme and proposal for regional cooperation (TCP or other project) in such areas as networking and information sharing, harmonization of diagnostics standards, regional disease reporting, sharing of technical expertise, etc.”

As an outcome of the above regional workshop, a TCP facility, TCP/RER/3206 “Assistance to Western Balkan Countries for Improving Compliance with International Standards on Aquatic Animal Health”, aimed at preparing a further regional proposal to FAO was approved in early 2009. The process of developing this regional TCP consisted of the following activities, which were undertaken to assess the status of national planning, policy and capacity for aquatic animal health in the five participating countries and identify the constraints to achieving national goals:

- i. A regional survey of aquatic animal health capacity and performance was conducted (from May to August 2009) involving five countries in the Western Balkan region (i.e. BiH, Croatia, The former Yugoslav Republic of Macedonia, Montenegro and Serbia).
- ii. Regional field assessment was undertaken by two FAO teams (May to August 2009) who visited the central veterinary services, main diagnostics laboratories and selected aquaculture facilities in each country to assess needs related to national programmes for aquatic animal health and to confirm survey findings.
- iii. In August 2009, the survey analysis was completed and a draft framework for a regional TCP proposal developed.
- iv. From 7 to 9 September, 2009, an FAO Regional Proposal Development Workshop “Assistance to Western Balkan Countries for Improving Compliance with International Standards for Aquatic Animal Health” was convened in Zagreb, Croatia to deliberate and achieve consensus on the essential components of the draft regional TCP proposal, including the implementation plan, time-line and responsibilities. During the workshop, the results of the Western Balkan Regional Aquatic Animal Health Capacity and Performance Survey and the field-based needs assessments were presented, and the draft framework for a regional proposal was outlined by the FAO team and discussed by the

workshop participants. Following incorporation of the recommendations of the workshop participants, the revised draft proposal was approved for submission to FAO for consideration.

The present regional TCP proposal is the outcome of completion of these activities.

## **OBJECTIVES OF THE ASSISTANCE**

The objectives of this Regional TCP Proposal address and build upon the technical areas identified during the 2008 regional workshop held in Sarajevo as having highest priority to assist all participating countries in developing capacity to implement international standards, i.e.: (i) risk analysis; (ii) disease surveillance, monitoring and reporting; (iii) disease diagnosis (including regional reference laboratories); and (iv) information and networking.

**The project's overall objective is to improve participating country compliance with international health standards** for aquatic animals by addressing key areas identified by the regional needs-assessment process so that countries are better able to maintain and improve national aquatic animal health status, harmonize standards regionally, and better comply with the health standard requirements of regional and international trading partners.

The specific objectives of the project are to:

- **build regional aquatic animal health capacity** (via workshops and training) on specific themes (legislation, risk analysis, surveillance (aquatic epidemiology), diagnostics, emergency preparedness/contingency planning, aquaculture development and promotion);
- **conduct a regional review and assessment of national legislation** to harmonize with respect to compliance with international aquatic animal health standards (World Trade Organization-Sanitary and Phytosanitary Agreement (SPS agreement), World Organisation for Animal Health (OIE) Aquatic Animal Health Code, European Union (EU) legislation);
- **design and implement a regional surveillance programme** for aquatic animal diseases; and
- **promote national, regional and international communication mechanisms and networking** systems for aquaculture development.

The completion of these key objectives will:

- Establish as a first priority, a project-based regional communication and networking system through a regional West Balkans Aquatic Animal Health (WBAAH) website.
- Improve understanding of international requirements for establishing and maintaining national surveillance systems for key aquatic animal diseases so that such systems can be established and/or improved via training.
- Improve or establish national monitoring and reporting systems for aquatic animal diseases through training of national staff and the establishment of regionally harmonized systems for registration of aquaculture production facilities, and a regional disease information database; and structure and conduct a regional disease monitoring programme for three or diseases important to improving regional aquatic animal health, defining disease-free zones within the region or providing data essential to proving disease absence.
- Improve national capacities to diagnose serious viral diseases of finfish and (where appropriate) parasitic diseases of molluscs to the standards outlined in the *OIE Manual for Aquatic Disease Diagnosis*; and establish mechanisms for laboratory networking among participating countries, including designation of a regional reference laboratory(ies).
- Improve national capacity and understanding of the application of risk analysis for the international and domestic movement of live aquatic animals through short-term training.
- Improve communication among policy-makers, diagnosticians, field staff and the private sector in each country by conducting a series of national workshops addressing areas of national priority; conducting a final project workshop involving senior national policy-makers and key representatives from the private sector and international and regional agencies.

- Build technical capacity to accomplish the above via a series of regional and national workshops, targeted short-term training and provision of a limited amount of essential equipment and materials.

## PROJECT OUTPUTS (RESULTS)

The project will thus aim to achieve the following major outputs:

1. **Regional workshops** – Four regional technical workshops and one regional aquaculture development workshop will be held during the project. Each workshop will deal with a key regional issue of importance to achieving project goals, with one workshop being organized in each of the participating countries.
2. **National workshops** – Each of the five participating countries will organize a single national workshop to discuss topics of national importance. The workshops will bring together public and private-sector stakeholders, including representatives from national, state and local veterinary agencies, diagnosticians, representatives of the aquaculture sector and other key players, and will also serve as a forum for disseminating progress in implementation of the regional TCP, as appropriate.
3. **Project terminal workshop** – A Project terminal workshop will be held in Sarajevo, BiH to review project accomplishments and identify future regional goals and possible mechanisms for achieving them. The workshop will include participation by national Ministers of Agriculture, Chief Veterinary Officers, other senior policy-makers, and representatives of relevant international agencies, the aquaculture industry and other key stakeholders.
4. **Regional legislative review** – Through the participation of the FAO Legal Service, a review of national legislation relevant to aquatic animal health will be conducted in each of the five participating countries, leading to country-specific recommendations for harmonization with international standards. The review will be conducted prior to the regional workshop on risk analysis and legislation so that the results can be presented and discussed during the workshop.
5. **Regional disease surveillance system and survey** – The project will assist countries in establishing a system of record keeping for aquaculture farms (including a farm registration system, where desired) and will improve relevant expertise in database management and data analysis and presentation. Standardized methodology will be developed and implemented to conduct a regional disease survey for a minimum of three regionally important diseases of finfish [e.g. viral haemorrhagic septicaemia (VHS), infectious pancreatic necrosis (IPN), koi herpesvirus (KHV), viral encephalopathy and retinopathy (VER)].
6. **West Balkan aquatic animal health (WBAAH) Web site** – The project will assist in establishing a web site and networking system for the region to provide current information on disease status, current aquatic animal health activities, contacts for key personnel and experts, hosting of discussion group(s), etc., to be hosted by one of the region's lead agencies or laboratories. The web site will serve as a focal center for project implementation.
7. **Short-term training** – A short-term training programme will be developed to include any regional or international short-term training required to permit participating countries to

accomplish the above objectives. Training will be accomplished by TCCT<sup>1</sup> or short-term work/study assignment of staff to institutes or laboratories having the specific expertise that can be transferred.

## WORK PLAN

The project's work plan is based on the following core principles:

- **Regional cooperation:** each participating country's national interests will be promoted by cooperation among all participating countries.
- **Team effort:** each activity will be jointly led by a team (FAO, regional project coordinator - RPC, national focal points - NFP, regional/international experts), regional participants and other interested partners (e.g. OIE, EU, donors).
- **Transparency:** a project-based communications portal, the Western Balkan Aquatic Animal Health (WBAAH) website, will provide information in both English and regional languages on project activities and assure transparency to all stakeholders
- **Continuity:** continuity will be achieved by forming a core group of regional aquatic animal health experts; each participating country will have four participants to each activity, two of whom will be participating in all activities.

Work plan objectives will be accomplished by completion of the following activities:

Activity 1: Establish and maintain the West Balkan Aquatic Animal Health (WBAAH) – The project will assist in establishing a website and networking system for the region to provide current information on disease status, current activities, contacts for key personnel and experts, hosting of discussion group(s), etc., to be hosted by one of the region's lead agencies or laboratories. The Web site will serve as a coordinating centre for project implementation.

Activity 2: Conduct a regional legislative review – Through the participation of FAO Legal Services, a review of national legislation relevant to aquatic animal health will be conducted, leading to country-specific recommendations for harmonization with international standards. The review will be conducted prior to the regional workshop on risk analysis and legislation so that the results can be presented during the workshop.

Activity 3: Establish a regional disease surveillance programme – The project will assist countries in establishing a system of record keeping for aquaculture farms (including a farm registration system, where desired) and will improve relevant expertise in database management and data analysis and presentation. Standardized methodology will be developed and implemented to conduct a regional disease survey for a minimum of three regionally important diseases of finfish [e.g. viral haemorrhagic septicaemia (VHS), infectious pancreatic necrosis (IPN), koi herpesvirus (KHV), viral encephalopathy and retinopathy (VER)].

Activity 4: Conduct a series of regional capacity-building workshops – Four regional technical workshops will be held during the project, each workshop will deal with a key regional technical issue of importance to achieving project goals, with one workshop being organized in each of the participating countries. A fifth workshop will advance regional aquaculture development via seeking ways to promote regional aquaculture development and the marketing of regional aquaculture products. The workshops will bring together key international regional and national players, including

---

<sup>1</sup> Technical Cooperation among Countries in Transition.

FAO staff, the Regional Project Coordinator (RPC), international and national consultants, participants from relevant international and regional agencies and donor organizations, national focal points, other national project participants, key national policy-makers, and representatives of private-sector aquaculture and fish processor groups, as appropriate. The general topics of the workshops and the agreed upon host countries will be:

- Improving national and regional disease surveillance, monitoring and reporting systems (Serbia)
- Improving capacity for diagnosis of diseases of fish and molluscs (BiH)
- Improving capacity for risk analysis for movements of live aquatic animals/harmonizing national legislation with international standards (Croatia)
- Improving national and regional contingency planning and emergency preparedness (The former Yugoslav Republic of Macedonia )
- Improving methods for regional aquaculture development and promotion (Montenegro)

Activity 5: Conduct a series of national workshops to promote information exchange and improve communication between key aquaculture stakeholders – Each of the five participating countries will organize a single national workshop to discuss topics of national importance. The workshops will bring together public and private-sector stakeholders, including representatives from national, state and local veterinary agencies, diagnosticians, representatives of the aquaculture sector and other key players, as appropriate.

Activity 6: Conduct a final project workshop and review – A final project workshop will be held in Sarajevo, BiH to review project accomplishments and identify future regional goals and possible mechanisms for achieving them. The meeting will include participation by national Ministers of Agriculture, Chief Veterinary Officers, other senior policy-makers, and representatives of relevant international agencies, the aquaculture industry and other key stakeholders.

Activity 7: Conduct short-term training of key national staff – A short-term training programme will developed to include any regional or international short-term training required to permit participating countries to accomplish the above objectives – training would be accomplished by TCCT or short-term work/study assignment of staff to institutes or laboratories having the specific expertise that can be transferred.

Activity 8: Provide key equipment and materials – A limited quantity of equipment and expendibles will be provided to participating countries to allow them to complete the above activities.

A brief description of the proposed regional and national workshops and short-term training can be found in Annex 1.

**Project management:** Project management will be accomplished by a Regional Programme Project Team comprised of the FAO Lead Technical Officer (LTO) and other backstopping officers, a Regional Project Coordinator (RPC), and national Focal Points (NFPs) on aquatic animal health (1 per country). Specific project activities will involve National Consultants (NC), Regional TCCT Expert(s), International Consultant(s) and partner experts (Partner Institution Expert), as appropriate.

Expertise not available within the region will be provided by two international consultants and the FAO backstopping technical officers. Short-term training in international laboratories will only take place should necessary facilities or expertise not be present within the region. This approach will

reduce language-related difficulties and will allow for most activities to be accomplished without the need for simultaneous translation.

In this work plan, the numbers given below correspond to the associated personnel:

1. One regional project coordinator (RPC)
2. Six national consultants:
  - National Consultant 1 (Legislation)
  - National Consultant 2 (Disease surveillance, monitoring and reporting)
  - National Consultant 3 (Diagnostics)
  - National Consultant 4 (Risk analysis)
  - National Consultant 5 (Contingency planning and emergency preparedness)
  - National Consultant 6 (Aquaculture development and promotion)
3. Three TCCT consultants
  - TCCT Consultant 1 (Diagnostics)
  - TCCT Consultant 2 (Aquatic animal health information systems)
  - TCCT Consultant 3 (Epidemiology)
4. Two International Consultants:
  - International Consultant 1 (Disease Surveillance, Monitoring and Reporting; Contingency Planning and Emergency Preparedness)
  - International Consultant 2 (Risk Analysis; Aquaculture Development and Promotion)
5. Four FAO Technical Backstopping Officers
  - Senior Aquaculture Officer (Aquaculture) from the Aquaculture Service (FIRA)
  - Aquaculture Officer (Aquatic Animal Health/Biosecurity Management) from the Aquaculture Service (FIRA)
  - Fishery Officer from the Subregional Office for Central and Eastern Europe (SEUM)
  - Legal Officer from the FAO Development Law Service (LEGN)

The detailed Terms of Reference for each of the personnel can be found in Annexes 2–14.

## **PROJECT TIMELINE**

The proposed regional TCP will be undertaken for 24 months. Details of project timeline can be found in Annex 15.

**Terms of Reference  
Workshops and training**

Description of training sessions and workshops:

*1) Regional Workshop 1 on Improving National and Regional Disease Surveillance, Monitoring and Reporting Systems*

Location of workshop: Serbia

Number of participants: 25–30 (4 participants from each participating country)

Duration of Workshops: 4 days

Objectives: To review the current status of national disease surveillance, monitoring and reporting systems and disease lists; develop a disease surveillance manual using a drainage basin approach, organize a Regional Disease Surveillance Programme, and to plan and implement a Regional Disease Survey for 3 diseases using international standards.

*2) Regional Workshop 2 on Improving Capacity for Diagnosis of Disease of Fish and Molluscs*

Location of workshop: Sarajevo, BiH

Number of participants: 25–30 (4 participants from each participating country)

Duration of Workshops: 4 days

Objectives: To review the current status of national disease diagnostics in participating countries, standardize diagnostics techniques in support of the Regional Disease Survey and provide targeted diagnostics training to participants.

*3) Regional Workshop 3 on Improving Risk Analysis for Movements of Live Aquatic Animals/Harmonizing National Legislation with International Standards*

Location of workshop: Croatia

Number of participants: 25–30 (4 participants from each participating country)

Duration of Workshops: 4 days

Objectives: To review the current status of risk analysis for aquatic animals in participating countries and to provide introductory training in risk analysis to participants; to present the results of the Regional Legislative Review and identify regional and national actions required to meet European Union and other international standards with regard to aquatic animal health.

*4) Regional Workshop 4 on Improving National and Regional Contingency Planning and Emergency Preparedness*

Location of workshop: The former Yugoslav Republic of Macedonia

Number of participants: 25–30 (4 participants from each participating country)

Duration of Workshops: 4 days

Objectives: To review the current status of national contingency planning and emergency preparedness, make recommendations for their improvement and to discuss and agree upon harmonized regional approaches and regional cooperation.

*5) Regional Workshop 5 on Improving Methods for Regional Aquaculture Development and Promotion*

Location of workshop: Montenegro

Number of participants: 25–30 (4 participants from each participating country)

Duration of Workshops: 4 days

Objectives: To review the current regional directions in aquaculture development and promotion in participating countries and to formulate regional mechanisms and action plans to more effectively promote West Balkan aquaculture products in international markets.

#### *6) Project Terminal Workshop*

Location of workshop: Sarajevo, BiH

Number of participants: 40–50

Duration of Workshops: 4 days

Objectives: To disseminate and share results and findings of the project and to exchange information on good aquatic animal health management practices between neighbouring states in order to build consensus and generate better understanding with trading partners on the importance of responsible aquatic animal health management for increasing healthy aquatic production, expanding responsible trade and contributing to poverty alleviation. To seek methods to continue regional coordination and cooperation on initiatives begun by the project.

#### *6) National Workshops (total of 5)*

Location of workshops: one workshop within each participating country (BiH, Croatia, The former Yugoslav Republic of Macedonia, Montenegro and Serbia)

Number of participants: 25–30

Duration of each workshops: 4 day

Objectives: To provide information and/or training to national staff and private-sector stakeholders on specific aspects of national aquatic animal health and/or aquaculture development. Precise topics to be determined by individual participating countries.

#### *7) Short-term training*

Location of training: Within participating countries, unless facilities and expertise in specific areas do not exist

Number of trainees: TBD

Duration of trainings: TBD

Objectives: To provide specific targeted short-term training to project participants to allow them to undertake the Regional Disease Survey and to improve capacity to meet international standards in aquatic animal health.

**Terms of Reference  
Regional Project Coordinator (RPC)**

The Regional Project Coordinator (RPC) will be appointed by FAO for the whole duration of the project to facilitate project implementation and ensure effective liaison and cooperation between the participating countries and the Project Team. In particular he/she will:

1. facilitate the set up of all arrangements for the project implementation, including visas for consultants, workshops, training sessions, missions, translation of documents, purchase of equipment, recruitment of staff, etc;
2. coordinate and monitor the activities of consultants;
3. liaise with country national focal points to ensure effective planning and implementation of national aspects of the project;
4. prepare and update work plans as required;
5. maintain good contacts with other stakeholders in the sector in order to increase their commitment to the project objectives and participation in project activities;
6. facilitate disbursement of payments of contracted services and costs related to the implementation of training activities;
7. prepare bi-monthly progress reports indicating achievements and major problems in project implementation; and
8. perform any other duties to assure successful implementation of the project.

**Qualifications:**

- several years of experience in coordinating fisheries and aquaculture activities in West Balkans;
- flexibility, ability of overcoming difficulties, maintaining good relationships among the team members;
- liaising in an amicable and effective way with other government, non-government and international organizations; and
- good command of verbal and written English.

Duty station: Home city within a participating country and in-country travels

**Terms of Reference**  
**National Consultant 1: aquatic animal health legislation**

Under the overall supervision of the Regional Representative for Europe (REUD), the technical supervision of FIRA Lead Technical Unit (LTU) Officer and FIRA Senior Aquaculture Officer, and in close collaboration with the Regional Project Coordinator and the LEGN Legal Officer, national consultant 1 on aquatic animal legislation will assist in the implementation of the regional review of national legislation and the Regional Workshop on Aquatic Animal Health Legislation/Risk Analysis. Specifically, the officer will perform the following duties:

First mission

1. assist the FAO LEGN Legal Officer in the collection and review of all relevant national legislation enacted by the five participating countries pertaining to aquatic animal health;
2. assist the FAO LEGN Legal Officer in the preparation of a report detailing the finding of the review and in drafting recommendations to participating countries regarding the need for revision of existing legislation or the enactment for new legislation; and
3. prepare a comprehensive report containing the above and submit to FAO/FIRA in both hard copy and electronic formats (in Microsoft Word 6).

Second mission

1. participate in Regional Workshop 2 (Legislation component) to present the findings of the Legislation Review;
2. participate in National Workshops, as appropriate; and
3. prepare a comprehensive report containing the above and submit to FAO/FIRA in both hard copy and electronic formats (in Microsoft Word 6).

Qualifications:

- university or related degree in law;
- at least five years of professional experience in law as it relates to aquaculture and aquatic animal health;
- experience with working in a participatory manner; and
- fluency in English and good communication and writing abilities.

Duty station: Home city within a participating country and intra-regional travels.

Duration: Two missions.

### Terms of Reference

#### National consultant 2: disease surveillance, monitoring and reporting

Under the overall supervision of the Regional Representative for Europe (REUD), the technical supervision of FIRA Lead Technical Unit (LTU) Officer and FIRA Senior Aquaculture Officer, the Regional Project Coordinator, and the International Consultant (Disease Surveillance/Contingency Planning), national Consultant 2 will assist in implementing the disease surveillance component of the project. Specifically, the officer will perform the following duties:

##### First mission

1. assist the International Consultant 1 (surveillance/contingency planning) and the RPC in planning and implementing a West Balkans Regional Aquatic Animal Disease Surveillance System including mechanisms for survey protocols, diagnostic methods, data collection and analysis, and regular reporting; and
2. assist the International Consultant 1 (surveillance/contingency planning) and the RPC in preparing a comprehensive report containing the above and submit to FAO/FIRA in both hard copy and electronic formats (in Microsoft Word 6).

##### Second Mission

1. Assist the RPC in preparing a mid-term report of survey results;
2. Participate in Regional Workshops 1 (Disease Surveillance) and 2 (Disease Diagnostics) ; and
3. Prepare a comprehensive report containing the above and submit to FAO/FIRA in both hard copy and electronic formats (in Microsoft Word 6).

##### Third mission

1. assist the RPC in preparing a final report of the regional disease survey; and
2. participate in the Project Terminal Workshop;

##### Qualifications:

- university or related degree in aquaculture/fisheries, veterinary medicine, food safety and quality;
- at least five years of professional experience in animal epidemiology, information systems, disease databases, surveillance and reporting.
- experience with working in a participatory manner;
- fluency in English, good communication and writing abilities.

Duty station: Home city within a participating country, with intra-regional travels.

Duration: Three missions.

**Terms of Reference**  
**National consultant 3: aquatic animal disease diagnostics**

Under the overall supervision of the Regional Representative for Europe (REUD), the technical supervision of the FIRA Lead Technical Unit (LTU) Officer, and the Regional Project Coordinator, national consultant 3 on aquatic animal disease diagnostics will assist in implementing the disease diagnostics component of the project. Specifically, the consultant will perform the following duties:

1. assist the International Consultant 1 in establishing the diagnostic components of the Regional Aquatic Animal Disease Surveillance Programme;
2. participate as a resource person in Regional Workshop 1 (Disease Surveillance, Monitoring and Reporting);
3. assist in organizing Regional Workshop 2 on Disease Diagnostics by preparing the report of the workshop;
4. assist FAO by reviewing requests from participating countries for diagnostics equipment, expendables and short-term, training needed to undertake the Regional Disease Survey; and
5. submit a comprehensive report to FAO/FIRA in both hard copy and electronic formats (in Microsoft Word 6).

Qualifications:

- university or related degree in aquatic animal health or veterinary medicine;
- at least five years of professional experience in the diagnosis of aquatic animal diseases, including direct experience with the diagnostics methods specified in the OIE Aquatic Animal Disease Diagnostics Manual;
- experience with working in a participatory manner; and
- fluency in English, good communication and writing abilities.

Duty station: Home city within the region and in-country travels.

Duration: Two missions.

**Terms of Reference**  
**National consultant 4: risk analysis**

Under the overall supervision of the Regional Representative for Europe (REUD), the technical supervision of FIRA Lead Technical Unit (LTU) Officer and FIRA Senior Aquaculture Officer, and in close collaboration with the Regional Project Coordinator and International Consultant (risk analysis/aquaculture development), Consultant 4 on risk analysis will assist in the implementation of the risk analysis component of the project. Specifically, the consultant will perform the following duties:

1. assist FAO, the RPC and International Consultant 2 in planning and organizing the risk analysis component of Regional Workshop<sup>3</sup> and serving as a resource person at the Workshop;
2. participate in as a resource person in risk analysis in National Workshops, as appropriate;
3. assist the FAO, the RPC and international consultant 2 in preparing the risk analysis component of the Workshop report; and
4. Prepare a comprehensive report containing the above and submit to FAO/FIRA in both hard copy and electronic formats (in Microsoft Word 6).

Qualifications:

- university or related degree in aquatic animal health or veterinary medicine;
- experience/familiarity with risk analysis methods as applied to the international movement of live aquatic animals and their products;
- experience with working in a participatory manner; and
- fluency in English, good communication and writing abilities

Duty station: Home country within the region and in-country travels.

Duration: One mission.

**Terms of Reference**  
**National consultant 5: contingency planning and emergency preparedness**

Under the overall supervision of the Regional Representative for Europe (REUD), the technical supervision of FIRA Lead Technical Unit (LTU) Officer and FIRA Senior Aquaculture Officer, and in close collaboration with the Regional Project Coordinator and international consultant 1 (Disease surveillance/contingency planning) consultant 4 on contingency planning and emergency preparedness will assist in the implementation of the contingency planning component of the project. Specifically, the consultant will perform the following duties:

1. assist FAO, the RPC and International Consultant 1 in planning and organizing the Regional Workshop 4 (Contingency Planning and Emergency Preparedness) and serving as a resource person at the Workshop;
2. participate in as a resource person in contingency planning and emergency preparedness in National Workshops, as appropriate;
3. assist the FAO, the RPC and International Consultant 1 in preparing the Workshop report; and
4. prepare a comprehensive report containing the above and submit to FAO/FIRA in both hard copy and electronic formats (in Microsoft Word 6).

**Qualifications:**

- university or related degree in aquatic animal health or veterinary medicine;
- five years experience in contingency planning/emergency preparedness for aquatic and/or terrestrial animal disease outbreaks;
- experience with working in a participatory manner; and
- fluency in English, good communication and writing abilities

**Duty station:** Home country within the region and in-country travels.

**Duration:** One mission.

**Terms of Reference**  
**National consultant 4: aquaculture development and promotion**

Under the overall supervision of the Regional Representative for Europe (REUD), the technical supervision of FIRA Senior Aquaculture Officer, and in close collaboration with the Regional Project Coordinator and international consultant (risk analysis/aquaculture development), consultant 6 on aquaculture development and promotion will assist in the implementation of the aquaculture development and promotion component of the project. Specifically, the consultant will perform the following duties:

1. assist FAO, the RPC and International Consultant 2 in planning and organizing the Regional Workshop 5 (Aquaculture Development and Promotion) and serving as a resource person at the Workshop;
2. participate in as a resource person in aquaculture development and promotion in National Workshops, as appropriate; and
3. assist the FAO, the RPC and International Consultant 2 in preparing the Workshop report; and
4. prepare a comprehensive report containing the above and submit to FAO/FIRA in both hard copy and electronic formats (in Microsoft Word 6).

Qualifications:

- university or related degree in a field related to aquaculture development or seafood marketing;
- experience/familiarity the development and promotion of regional aquaculture and with global trends in aquaculture development and the marketing of aquaculture and capture fisheries products;
- experience with working in a participatory manner; and
- fluency in English, good communication and writing abilities.

Duty station: Home country within the region and in-country travels.

Duration: One mission.

### Terms of Reference

#### **International consultant 1: disease surveillance, monitoring and reporting; contingency planning and emergency preparedness**

Under the overall supervision of the Regional Representative for Europe (REUD), the technical supervision of FIRA Lead Technical Unit (LTU) Officer and FIRA Senior Aquaculture Officer, and in close collaboration with the Regional Project Coordinator and national consultants 2 and 5, international consultant 1 will assist in the implementation of the disease surveillance and contingency planning aspects of the project. Specifically, the consultant will perform the following duties:

##### First mission

1. conduct Regional Workshop 1 on Improving National and Regional Disease Surveillance, Monitoring and Reporting Systems;
2. prepare the Report for Workshop 1
3. plan and assist in the implementation of the Regional Aquatic Animal Disease Surveillance Programme;
4. provide guidance and technical inputs into the design and implementation of the Regional Disease Survey; and
5. submit a comprehensive report to FAO/FIRA LTU in both hard copy and electronic formats (in Microsoft Word 6).

##### Second mission

1. conduct Regional Workshop 4 on Improving National and Regional Contingency Planning and Emergency Preparedness;
2. prepare the report for Workshop 4;
3. evaluate the status of the Regional Disease Survey and make recommendations to address any problems or short-comings; and
4. submit a comprehensive report to FAO/FIRA LTU in both hard copy and electronic formats (in Microsoft Word 6).

##### Qualifications:

- university or related degree in aquatic animal health, epidemiology or veterinary medicine;
- at least five years experience in contingency planning and emergency preparedness for outbreaks of aquatic and/or terrestrial animal diseases;
- experience with working in a participatory manner; and
- fluency in English, good communication and writing abilities.

Duty station: Home base and travels to countries within the West Balkan region.

Duration: Two missions.

**Terms of Reference**  
**International consultant 2 – risk analysis and**  
**aquaculture development and promotion**

Under the overall supervision of the Regional Representative for Europe (REUD), the technical supervision of FIRA Lead Technical Unit (LTU) Officer and FIRA Senior Aquaculture Officer, and in close collaboration with the Regional Project Coordinator, and national consultants 4 and 6, international consultant 2 will assist in implementing the risk analysis and aquaculture development and promotion components of the project. Specifically, the consultant will perform the following duties:

First mission

1. conduct the risk analysis component of Workshop 3 (Improving the Capacity for Risk Analysis of Movements of Live Aquatic Animals/Harmonizing National Legislation);
2. prepare the risk analysis portion of the Report for Workshop 3; and
3. submit a comprehensive report to FAO/FIRA LTU in both hard copy and electronic formats (in Microsoft Word 6).

Second mission

1. participate as resource expert in Regional Workshop 5 on Improving Methods for Regional Aquaculture Development and Promotion;
2. prepare the report of Workshop 5; and
3. submit a comprehensive report to FAO/FIRA LTU in both hard copy and electronic formats (in Microsoft Word 6).

Qualifications:

- university or related degree in aquaculture, aquatic animal health or veterinary medicine;
- at least five years experience in conducting pathogen risk analysis for aquatic animals and in risk analysis training;
- broad familiarity with global aquaculture systems and trends in aquaculture development and promotion;
- extensive experience in scientific and technical writing and editing;
- experience with working in a participatory manner; and
- fluency in English.

Duty station: Home country and in-country travels.

Duration: Two missions.

**Terms of Reference**  
**FAO Technical Support Services: FIRA Senior Aquaculture Officer**

Under the overall supervision of the Regional Representative for Europe (REUD, the FIRA Senior Fisheries Officer, in close consultation with the Lead Technical Unit (LTU) Officer of the Project, the Regional Project Coordinator, and all the international consultants, national consultants and other FAO officers, will carry out Supervisory Technical Services (STS) part of project implementation. The Senior Aquaculture Officer, while providing technical advice to the relevant FAO staff and national/international consultants throughout the project, will specifically undertake the following tasks:

First mission

1. participate as resource expert to the Regional Workshop 5 on Aquaculture Development and Promotion;
2. provide technical advice to other relevant FAO experts and national/international consultants on project implementation; and
3. prepare mission and back-to-office report.

Second mission:

1. participate as Resource Expert to the Project Terminal Workshop;
2. provide technical advice to the other relevant FAO experts and national/international consultants; and
3. prepare mission and back-to-office report.

Duty station: FAO Headquarters with in-country travels.

Duration: Two missions.

**Terms of Reference**  
**FAO Technical Support Services:**  
**FIRA Aquaculture Officer (Aquatic Animal Health/Biosecurity)**

Under the overall supervision of the Regional Representative for Europe, REUD, this officer will serve as the Lead Technical Unit (LTU) Officer of the Project and in close consultation with the Senior FIRA Officer and the Regional Project Coordinator, and will be responsible for the overall implementation of the Project. Specifically, the officer will perform the following duties:

First mission

1. revise the Implementation Plan of the Project based on discussions with the Regional Project Coordinator and National Focal Points;
2. revise the budgetary requirements of the Project, if necessary;
3. review and evaluate requests for short-term training;
4. review and evaluate the candidates for National and International Consultants;
5. supervise detailed planning for establishment of the West Balkans Aquatic Animal Health Website, the Regional Legislative Review and the Regional Disease Surveillance Programme and Regional Disease Survey;
6. conduct planning and assess requirements for the next set of activities that will be undertaken during months 4–6; and
7. prepare mission and back-to-office report.

Second mission

1. serve as a Resource Expert at Regional Workshop 1;
2. evaluate requests for equipment and expendables;
3. read and review consultants reports; and
4. prepare mission and a back-to-office report.

Third mission

1. serve as Resource Person to Regional Workshop 2;
2. conduct planning and assess requirements for the next set of activities that will be undertaken during months 7–9; and
3. prepare mission and a back-to-office report.

Project activity schedule

**The FAO Regional Proposal Development Workshop “Assistance to Western Balkan Countries for Improving Compliance with International Standards for Aquatic Animal Health” was convened by FAO as part of the implementation of the FAO/TCP/RER/3206.**

**This regional workshop was used to explore the possibilities for a regional cooperation and development proposal to address common problems related to pathogen issues affecting regional trade between Western Balkan countries.**

**The workshop received active participation and strong interest and support in the development of the regional proposal.**

**The development followed a systematic, logical and transparent process and resulted to strong consensus on the scope and elements of the regional proposal through regional cooperation.**
