#### Abstract

We calculate the CP-averaged branching ratios and CP-violating asymmetries of a number of two-body charmless hadronic decays $\overline{B_{s}^{0}} \rightarrow P P, P V, V V$ in the perturbative QCD ( pQCD ) approach to leading order in $\alpha_{s}$ (here $P$ and $V$ denote light pseudo-scalar and vector mesons, respectively). The mixinginduced $C P$ violation parameters are also calculated for these decays. We also predict the polarization fractions of $B_{s} \rightarrow V V$ decays and find that the transverse polarizations are enhanced in some penguin dominated decays such as $\overline{B_{s}^{0}} \rightarrow K^{*} \overline{K^{*}}, K^{*} \rho$. Some of the predictions worked out here can already be confronted with the recently available data from the CDF collaboration on the branching ratios for the decays $\overline{B_{s}^{0}} \rightarrow K^{+} \pi^{-}, \overline{B_{s}^{0}} \rightarrow K^{+} K^{-}$and the CP-asymmetry in the decay $\overline{B_{s}^{0}} \rightarrow K^{+} \pi^{-}$, and are found to be in agreement within the current errors. A large number of predictions for the branching ratios, CP-asymmetries and vector-meson polarizations in $\overline{B_{s}^{0}}$ decays, presented in this paper and compared with the already existing results in other theoretical frameworks, will be put to stringent experimental tests in forthcoming experiments at Fermilab, LHC and Super B-factories.

## I. INTRODUCTION

There has been remarkable progress in the study of exclusive charmless $\overline{B_{d}^{0}} \rightarrow h_{1} h_{2}$ and $B^{ \pm} \rightarrow h_{1} h_{2}$ decays, where $h_{1}, h_{2}$ are light pseudo-scalar and/or vector mesons. Historically, these decays were calculated in the so-called naive factorization approach [1], which was improved by including some perturbative QCD contributions [2, 3]. Currently, there are three popular theoretical approaches to study the dynamics of these decays, which go under the name QCD factorization (QCDF) [4], perturbative QCD (pQCD) [5], and soft-collinear effective theory (SCET) [6]. All three are based on power expansion in $1 / m_{b}$, where $m_{b}$ is the $b$-quark mass. Factorization of the hadronic matrix elements $\left\langle h_{1} h_{2}\right| \mathcal{O}_{i}|B\rangle$, where $\mathcal{O}_{i}$ is typically a four-quark or a magnetic moment type operator, is shown to exist in the leading power in $1 / m_{b}$ in a class of decays. In addition, these approaches take into account some contributions in the decays $B \rightarrow h_{1} h_{2}$ not included in the earlier attempts [1, 2, 3], in particular the so-called hard spectator graphs.

Despite being embedded in the $\Lambda / m_{b}$ approach, justified by both the large mass, $m_{b}=O(5$ GeV ), and a large energy release in the decay, with $E_{h_{i}}=m_{B} / 2$, these methods differ significantly from each other in a number of important aspects. For example, these differences pertain to whether one takes into account the collinear degrees of freedom only as in QCDF and SCET, or includes also the transverse momenta implemented using the Sudakov formalism, as followed in the pQCD method. Also, in pQCD, the power counting is different from the one in QCDF, which makes some amplitudes differ significantly in the two approaches. The other differing feature of pQCD and QCDF is the scale at which strong interaction effects, including the Wilson coefficients, are calculated. In pQCD, this scale is low, typically of order $1-2 \mathrm{GeV}$. In QCDF, typical scales for the Wilson coefficients are taken as $O\left(m_{b}\right)$, following arguments based on factorization. There also exist detailed differences between QCDF and SCET, despite the fact that dedicated studies in the context of SCET have allowed to gain a better understanding of the QCDF framework. These differences, though not inherent, lie in how practically the calculations are done in the two approaches and involve issues such as the treatment of the so-called charming penguin contributions [7] to the decays $B \rightarrow h_{1} h_{2}$. These are argued to be power-suppressed in QCDF, and left as phenomenological parameters to be determined by data in SCET. Likewise, the treatment of the hard spectator contribution in these two approaches is also different. We recall that a generic factorization formula [8]

$$
\begin{equation*}
\left\langle h_{1} h_{2}\right| \mathcal{O}_{i}|B\rangle=\Phi_{h_{2}}(u) *\left(T^{I}(u) F^{B h_{1}}(0)+C^{I I}(\tau, u) * \Xi^{B h_{1}}(\tau, 0)\right) \tag{1}
\end{equation*}
$$

involves the QCD form factor $F^{B h_{1}}(0)$ and an unknown, non-local form factor $\Xi^{B h_{1}}(\tau, 0)$. In QCDF, this non-local form factor factorizes into light-cone distribution amplitudes and a jet function $J(\tau, \omega, v)$, when the hard-collinear scale $\sqrt{m_{b} \Lambda}$ is integrated out. This interpretation of the hard spectator contribution was not at hand in the BBNS papers [4], but was gained subsequently in the SCET-analysis of the form factors [9]. Amusingly, this SCET-result is not used in the SCET-based phenomenology in $B \rightarrow h_{1} h_{2}$ decays, for example in the works of Bauer et al. [10], where the use of perturbation theory at the scale $\sqrt{m_{b} \Lambda}$ is avoided. Detailed comparisons of their predictions with the data for the decays of the $\overline{B_{d}^{0}}$ (and its charge conjugate) and $B^{ \pm}$mesons have been made in the literature. We also refer to a recent critique [8] of the underlying theoretical assumptions in the three methods. Data from the B-factory experiments, BABAR and BELLE, as well as the CDF collaboration at the Tevatron, do provide some discrimination among them. With the advent of the LHC physics program, and the steadily improving experimental precision at the existing facilities, it should be possible to disentangle the underlying dynamics in hadronic $B$-decays.

The experimental program to study non-leptonic decays $\overline{B_{s}^{0}} \rightarrow h_{1} h_{2}$ has also started [11], with first measurements for the branching ratios $\overline{B_{s}^{0}} \rightarrow K^{+} \pi^{-}$and $\overline{B_{s}^{0}} \rightarrow K^{+} K^{-}$made available recently by the CDF collaboration [12, 13] at the proton-antiproton collider Tevatron. Remarkably, the first direct CP asymmetry involving the decay $\overline{B_{s}^{0}} \rightarrow K^{+} \pi^{-}$and its CP conjugate mode has also been reported by CDF [13], which is found to be large, with $A_{\mathrm{CP}}\left(\overline{B_{s}^{0}} \rightarrow K^{+} \pi^{-}\right)=(39 \pm 15 \pm 8) \%$. This is in agreement with the predictions of the pQCD approach, as we also quantify in this paper. With the ongoing $B$-Physics program at the Tevatron, but, in particular, with the onset of the LHC experiments, as well as the Super B-factories being contemplated for the future, we expect a wealth of data involving the decays of the hitherto less studied $\overline{B_{s}^{0}}$ meson. The charmless $\overline{B_{s}^{0}} \rightarrow h_{1} h_{2}$ decays are important for the CP asymmetry studies and the determination of the inner angles of the unitarity triangle, in particular $\gamma$ (or $\phi_{3}$ ), which has not yet been precisely measured. In addition, a number of charmless decays $\overline{B_{s}^{0}} \rightarrow h_{1} h_{2}$ can be related to the $\overline{B_{d}^{0}} \rightarrow h_{1} h_{2}$ decays using $\operatorname{SU}(3)$ (or U-spin) symmetry, and hence data on these decays can be combined to test the underlying standard model and search for physics beyond the SM under less (dynamical) model-dependent conditions. Anticipating the experimental developments, many studies have been devoted to the interesting charmless $\overline{B_{s}^{0}} \rightarrow h_{1} h_{2}$ decays. Among others, they include detailed estimates undertaken in the naive factorization framework [14] , the so-called generalized factorization approach [15], QCDF [16, 17, 18], pQCD [19] and SCET [20]. There are
also many studies [21] undertaken, parameterizing the various parts of the decay amplitudes using distinct topologies and the flavor symmetries to relate the $\overline{B_{s}^{0}} \rightarrow h_{1} h_{2}$ and $\overline{B_{d}^{0}} \rightarrow h_{1} h_{2}$ decays. Possible New Physics effects in these decays have also been explored [22].

In the applications of the PQCD approach to $\overline{B_{s}^{0}} \rightarrow h_{1} h_{2}$ decays, the currently available works concentrate on specific decays. However, a comprehensive study of the decays $\overline{B_{s}^{0}} \rightarrow h_{1} h_{2}$, which have been undertaken in QCDF and SCET, to the best of our knowledge, is still lacking in pQCD. Our aim is to fill in this gap and provide a ready reference to the existing and forthcoming experiments to compare their data with the predictions in the pQCD approach. In doing this, we have included the current information on the CKM matrix elements, updated some input hadronic parameters and have calculated the decay form factors in the pQCD approach. Since these form factors have to be provided from outside in QCDF and SCET (such as by resorting to QCD sum rules), there is already a potential source of disagreement among these approaches on this count. However, we remark that the estimates presented here for the cases $B_{s} \rightarrow P P, P V, V V$ are rather similar to the corresponding ones in the existing literature on the light cone QCD sum rules. Thus, theoretical predictions presented in this work reflect the detailed assumptions about the dynamics endemic to pQCD , such as the effective scales which are generated by the strong interaction aspects of the weak non-leptonic two-body decays, setting the relative strengths of the various competing amplitudes in magnitudes and phases. As we work in the leading order $(\mathrm{LO})$ in $\alpha_{s}$, there is considerable uncertainty related to the scale-dependence, which we quantify in the estimates of the branching ratios, CP-asymmetries and polarization fractions for the decays considered in this paper. Likewise, parametric uncertainties in the numerical estimates of these quantities resulting from other input parameters are worked out. Together, they quantify the theoretical imprecision in $\overline{B_{s}^{0}} \rightarrow h_{1} h_{2}$ decays at the current stage in the pQCD approach. We have made detailed comparison of our predictions with the existing literature on the decays $\overline{B_{s}^{0}} \rightarrow h_{1} h_{2}$ and in some benchmark decay widths and rate asymmetries in the corresponding $\overline{B_{d}^{0}} \rightarrow h_{1} h_{2}$ decays. Whenever available, we have also compared our predictions with the data and found that they are generally compatible with each other.

We also present numerical results for some selected ratios of the branching ratios involving the decays $\overline{B_{s}^{0}} \rightarrow K^{+} K^{-}, \overline{B_{s}^{0}} \rightarrow K^{+} \pi^{-}, \overline{B_{d}^{0}} \rightarrow \pi^{+} \pi^{-}$and $\overline{B_{d}^{0}} \rightarrow K^{-} \pi^{+}$, which are related by $\mathrm{SU}(3)$ and U-spin symmetries. For comparison with other approaches, we also give in Table IV the contributions of the various topologies for these decays. The ratios worked out numerically are: $R_{1} \equiv \frac{B R\left(\overline{B_{s}^{0}} \rightarrow K^{+} K^{-}\right)}{B R\left(\overline{B_{d}^{0}} \rightarrow \pi^{+} \pi^{-}\right)}, R_{2} \equiv \frac{B R\left(\overline{B_{s}^{0}} \rightarrow K^{+} K^{-}\right)}{B R\left(\overline{B_{d}^{0}} \rightarrow K^{-} \pi^{+}\right)}$, and two more, called $R_{3}$ and $\Delta$, defined in Eq. (72)
and (73), respectively, which involve the decays $\overline{B_{d}^{0}} \rightarrow K^{-} \pi^{+}$and $\overline{B_{s}^{0}} \rightarrow K^{+} \pi^{-}$and their charge conjugates. All these ratios have been measured experimentally and the pQCD-based estimates presented here are in agreement with the data, except possibly the ratio $R_{1}$ which turns out too small. Whether this reflects an intrinsic limitation of the pQCD approach or the inadequacy of the LO framework remains to be seen, as complete next-to-leading order (NLO) calculations of all the relevant pieces of the $B \rightarrow h_{1} h_{2}$ decay matrix elements are still not in place. However, there are sound theoretical arguments why the ratios $R_{2}, R_{3}$ and $\Delta$ are protected against higher order QCD corrections, such as the charge conjugation invariance of the strong interactions (for $R_{3}$ and $\Delta)$, and the dominance of the decay amplitudes in the numerator and denominator in the ratio $R_{2}$ by a single decay topology. The agreement between the pQCD approach and data in these quantities is, therefore, both non-trivial and encouraging.

This paper is organized as follows: In section II, we briefly review the pQCD approach and give the essential input quantities that enter the pQCD approach, including the operator basis used subsequently and the numerical values of the Wilson coefficients together with their scale dependence. The wave function of the $\overline{B_{s}^{0}}$-meson, the distribution amplitudes for the light pseudo-scalar and vector mesons and the input values of the various mesonic decay constants are also given here. Section III contains the calculation of the $\overline{B_{s}^{0}} \rightarrow P P$ mesons, making explicit the contributions from the so-called emission and annihilation diagrams. Numerical results for the charge-conjugated averages of the decay branching ratios, direct CP-asymmetries, the time-dependent CP asymmetries $S_{f}$ and the observables $H_{f}$ in the time-dependent decay rates are tabulated in Tables III, V and VI, respectively. These tables also contain detailed comparisons of our work with the corresponding numerical results obtained in the QCDF and SCET approaches, as well as with the available data. Section IV contains the numerical results for the decays $\overline{B_{s}^{0}} \rightarrow P V$. They are presented in Tables VII, VIII and IX for the charge-conjugated averages of the decay branching ratios, time-integrated CP-asymmetries, the time-dependent CP asymmetries $S_{f}$ and the observables $H_{f}$ in the time-dependent decay rates, respectively. We also show the corresponding results from the QCDF approach in Tables VII and VIII. Section V is devoted to a study of the decays $\overline{B_{s}^{0}} \rightarrow V V$, making explicit the amplitudes for the longitudinal ( L ), normal ( N ) and transverse ( T ) polarization components of the vector mesons. Numerical results for the CP-averaged branching ratios are presented in Table X , and compared with the corresponding results from the QCDF approach, updated recently in Ref. [18], and available data. Results for the three polarization fractions $f_{0}, f_{\|}, f_{\perp}$, the relative strong phases $\phi_{\|}(\mathrm{rad}), \phi_{\perp}(\mathrm{rad})$ and the CP-asymmetries are
displayed in Table XI. Appendix A contains the various functions that enter the factorization formulae in the pQCD approach. Appendix B gives the analytic formulae for the $\overline{B_{s}^{0}} \rightarrow P P$ decays used in the numerical calculations, while the details of the formulae for the decays $\overline{B_{s}^{0}} \rightarrow P V$ and $\overline{B_{s}^{0}} \rightarrow V V$ are relegated to Appendix C and D , respectively.

## II. THE EFFECTIVE HAMILTONIAN AND THE INPUT QUANTITIES

## A. Notations and Conventions

We specify the weak effective Hamiltonian [23]:

$$
\begin{equation*}
\mathcal{H}_{e f f}=\frac{G_{F}}{\sqrt{2}}\left\{V_{u b} V_{u q}^{*}\left[C_{1}(\mu) Q_{1}^{u}(\mu)+C_{2}(\mu) Q_{2}^{u}(\mu)\right]-V_{t b} V_{t q}^{*}\left[\sum_{i=3}^{10} C_{i}(\mu) Q_{i}(\mu)\right]\right\}+\text { H.c. } \tag{2}
\end{equation*}
$$

where $q=d, s$. The functions $Q_{i}(i=1, \ldots, 10)$ are the local four-quark operators:

- current-current (tree) operators

$$
\begin{equation*}
Q_{1}^{u}=\left(\bar{u}_{\alpha} b_{\beta}\right)_{V-A}\left(\bar{q}_{\beta} u_{\alpha}\right)_{V-A}, \quad Q_{2}^{u}=\left(\bar{u}_{\alpha} b_{\alpha}\right)_{V-A}\left(\bar{q}_{\beta} u_{\beta}\right)_{V-A}, \tag{3}
\end{equation*}
$$

- QCD penguin operators

$$
\begin{array}{ll}
Q_{3}=\left(\bar{q}_{\alpha} b_{\alpha}\right)_{V-A} \sum_{q^{\prime}}\left(\bar{q}_{\beta}^{\prime} q_{\beta}^{\prime}\right)_{V-A}, & Q_{4}=\left(\bar{q}_{\beta} b_{\alpha}\right)_{V-A} \sum_{q^{\prime}}\left(\bar{q}_{\alpha}^{\prime} q_{\beta}^{\prime}\right)_{V-A}, \\
Q_{5}=\left(\bar{q}_{\alpha} b_{\alpha}\right)_{V-A} \sum_{q^{\prime}}\left(\bar{q}_{\beta}^{\prime} q_{\beta}^{\prime}\right)_{V+A}, & Q_{6}=\left(\bar{q}_{\beta} b_{\alpha}\right)_{V-A} \sum_{q^{\prime}}\left(\bar{q}_{\alpha}^{\prime} q_{\beta}^{\prime}\right)_{V+A}, \tag{5}
\end{array}
$$

- electro-weak penguin operators

$$
\begin{align*}
Q_{7} & =\frac{3}{2}\left(\bar{q}_{\alpha} b_{\alpha}\right)_{V-A} \sum_{q^{\prime}} e_{q^{\prime}}\left(\bar{q}_{\beta}^{\prime} q_{\beta}^{\prime}\right)_{V+A}, & Q_{8} & =\frac{3}{2}\left(\bar{q}_{\beta} b_{\alpha}\right)_{V-A} \sum_{q^{\prime}} e_{q^{\prime}}\left(\bar{q}_{\alpha}^{\prime} q_{\beta}^{\prime}\right)_{V+A},  \tag{6}\\
Q_{9} & =\frac{3}{2}\left(\bar{q}_{\alpha} b_{\alpha}\right)_{V-A} \sum_{q^{\prime}} e_{q^{\prime}}\left(\bar{q}_{\beta}^{\prime} q_{\beta}^{\prime}\right)_{V-A}, & Q_{10} & =\frac{3}{2}\left(\bar{q}_{\beta} b_{\alpha}\right)_{V-A} \sum_{q^{\prime}} e_{q^{\prime}}\left(\bar{q}_{\alpha}^{\prime} q_{\beta}^{\prime}\right)_{V-A}, \tag{7}
\end{align*}
$$

where $\alpha$ and $\beta$ are the color indices and $q^{\prime}$ are the active quarks at the scale $m_{b}$, i.e. $q^{\prime}=$ $(u, d, s, c, b)$. The left handed current is defined as $\left(\bar{q}_{\alpha}^{\prime} q_{\beta}^{\prime}\right)_{V-A}=\bar{q}_{\alpha}^{\prime} \gamma_{\nu}\left(1-\gamma_{5}\right) q_{\beta}^{\prime}$ and the right handed current $\left(\bar{q}_{\alpha}^{\prime} q_{\beta}^{\prime}\right)_{V+A}=\bar{q}_{\alpha}^{\prime} \gamma_{\nu}\left(1+\gamma_{5}\right) q_{\beta}^{\prime}$. The combinations $a_{i}$ of Wilson coefficients are defined as usual [3]:

$$
\begin{align*}
& a_{1}=C_{2}+C_{1} / 3, a_{3}=C_{3}+C_{4} / 3, a_{5}=C_{5}+C_{6} / 3, a_{7}=C_{7}+C_{8} / 3, a_{9}=C_{9}+C_{10} / 3 \\
& a_{2}=C_{1}+C_{2} / 3, a_{4}=C_{4}+C_{3} / 3, a_{6}=C_{6}+C_{5} / 3, a_{8}=C_{8}+C_{7} / 3, a_{10}=C_{10}+C_{9} / 3 \tag{8}
\end{align*}
$$

Since we work in the leading order of perturbative QCD $\left(O\left(\alpha_{s}\right)\right)$, it is consistent to use the leading order Wilson coefficients. The scale $\mu$ characterizes the typical scale for the hard scattering, and for four different values of this scale the results of the Wilson coefficients are listed in Table I. It is seen that the coefficient $a_{2}$ and the penguin operator Wilson coefficients $a_{3}, a_{5}$ have a large dependence on the scale which will give large uncertainties to those channels highly dependent on them, such as the color-suppressed QCD penguin dominant processes. This situation is typical of leading order estimates; the reduction in the scale-dependence requires the calculation of next-toleading order results which are beyond the theoretical accuracy to which we are working.

We consider the $\bar{B}_{s}^{0} \rightarrow M_{2} M_{3}$ decay. In the emission type diagrams with the spectator quark $\bar{s}$ from the initial state $\bar{B}_{s}$ recombining to form the meson $M_{3}$, we denote the emitted meson as $M_{2}$ while the recoiling meson is $M_{3}$. The factorization formula is then denoted as $F_{\bar{B}_{s} \rightarrow M_{3}}$. It is convenient to define two light-like vectors: $n$ and $v$. These two vectors satisfy $n^{2}=v^{2}=0$ and $n \cdot v=1$. The meson $M_{2}$ is moving along the direction of $n=\left(1,0, \mathbf{0}_{T}\right)$ and $M_{3}$ is on $v=\left(0,1, \mathbf{0}_{T}\right)$, we use $x_{i}$ to denote the momentum fraction of the anti-quark in each meson, $k_{i \perp}$ to denote the

FIG. 1: The notation in our calculation
transverse momentum of the anti-quark:

$$
\begin{align*}
P_{B} & =\frac{M_{B_{s}}}{\sqrt{2}}\left(1,1, \mathbf{0}_{T}\right), \quad P_{2}=\frac{M_{B_{s}}}{\sqrt{2}}\left(1,0, \mathbf{0}_{T}\right), \quad P_{3}=\frac{M_{B_{s}}}{\sqrt{2}}\left(0,1, \mathbf{0}_{T}\right), \\
k_{1} & =\left(x_{1} \frac{M_{B_{s}}}{\sqrt{2}}, 0, \mathbf{k}_{1 \perp}\right), \quad k_{2}=\left(x_{2} \frac{M_{B_{s}}}{\sqrt{2}}, 0, \mathbf{k}_{2 \perp}\right), \quad k_{3}=\left(0, x_{3} \frac{M_{B_{s}}}{\sqrt{2}}, \mathbf{k}_{3 \perp}\right), \tag{9}
\end{align*}
$$

which are shown in Figure 1 .

## B. Wave Functions of the $B_{s}$ Meson

In order to calculate the analytic formulas of the decay amplitude, we use the light cone wave functions $\Phi_{M, \alpha \beta}$ decomposed in terms of the spin structure. In general, $\Phi_{M, \alpha \beta}$ with Dirac indices $\alpha, \beta$ can be decomposed into 16 independent components, $1_{\alpha \beta}, \gamma_{\alpha \beta}^{\mu}, \sigma_{\alpha \beta}^{\mu \nu},\left(\gamma^{\mu} \gamma_{5}\right)_{\alpha \beta}, \gamma_{5 \alpha \beta}$. If the considered meson $M$ is the $B_{s}$ meson, a heavy pseudo-scalar meson, the $B_{s}$ meson light-cone matrix element can be decomposed as [24, 25]

$$
\begin{align*}
& \int d^{4} z e^{i k_{1} \cdot z}\langle 0| \bar{b}_{\alpha}(0) s_{\beta}(z)\left|B_{s}\left(P_{B_{s}}\right)\right\rangle \\
= & \frac{i}{\sqrt{6}}\left\{\left(P_{B_{s}}+M_{B_{s}}\right) \gamma_{5}\left[\phi_{B_{s}}\left(k_{1}\right)-\frac{\not n-\not ̂}{\sqrt{2}} \bar{\phi}_{B_{s}}\left(k_{1}\right)\right]\right\}_{\beta \alpha} . \tag{10}
\end{align*}
$$

From the above equation, one can see that there are two Lorentz structures in the $B_{s}$ meson distribution amplitudes. They obey the following normalization conditions

$$
\begin{equation*}
\int \frac{d^{4} k_{1}}{(2 \pi)^{4}} \phi_{B_{s}}\left(k_{1}\right)=\frac{f_{B_{s}}}{2 \sqrt{6}}, \quad \int \frac{d^{4} k_{1}}{(2 \pi)^{4}} \bar{\phi}_{B_{s}}\left(k_{1}\right)=0 . \tag{11}
\end{equation*}
$$

In general, one should consider these two Lorentz structures in the calculations of $B_{s}$ meson decays. However, it is found that the contribution of $\bar{\phi}_{B_{s}}$ is numerically small [26], thus its
contribution can be neglected. With this approximation, we only retain the first term in the square bracket from the full Lorentz structure in Eq. (10)

$$
\begin{equation*}
\Phi_{B_{s}}=\frac{i}{\sqrt{6}}\left(P_{B_{s}}+M_{B_{s}}\right) \gamma_{5} \phi_{B_{s}}\left(k_{1}\right) . \tag{12}
\end{equation*}
$$

In the next section, we will see that the hard part is always independent of one of the $k_{1}^{+}$and/or $k_{1}^{-}$, if we make the approximations shown in the next section. The $B_{s}$ meson wave function is then a function of the variables $k_{1}^{-}$(or $k_{1}^{+}$) and $k_{1}^{\perp}$ only,

$$
\begin{equation*}
\phi_{B_{s}}\left(k_{1}^{-}, k_{1}^{\perp}\right)=\int \frac{d k_{1}^{+}}{2 \pi} \phi_{B_{s}}\left(k_{1}^{+}, k_{1}^{-}, k_{1}^{\perp}\right) . \tag{13}
\end{equation*}
$$

Then, the $B_{s}$ meson's wave function in the $b$-space can be expressed by

$$
\begin{equation*}
\Phi_{B_{s}}(x, b)=\frac{i}{\sqrt{6}}\left[P_{B_{s}} \gamma_{5}+M_{B_{s}} \gamma_{5}\right] \phi_{B_{s}}(x, b), \tag{14}
\end{equation*}
$$

where $b$ is the conjugate space coordinate of the transverse momentum $k^{\perp}$.
In this study, we use the model function similar to that of the $B$ meson which is

$$
\begin{equation*}
\phi_{B_{s}}(x, b)=N_{B_{s}} x^{2}(1-x)^{2} \exp \left[-\frac{M_{B_{s}}^{2} x^{2}}{2 \omega_{b}^{2}}-\frac{1}{2}\left(\omega_{b} b\right)^{2}\right], \tag{15}
\end{equation*}
$$

with $N_{B_{s}}$ the normalization factor. In recent years, a lot of studies have been performed for the $B_{d}^{0}$ and $B^{ \pm}$decays in the pQCD approach [5]. The parameter $\omega_{b}=0.40 \mathrm{GeV}$ has been fixed there using the rich experimental data on the $B_{d}^{0}$ and $B^{ \pm}$mesons. In the $\mathrm{SU}(3)$ limit, this parameter should be the same in $B_{s}$ decays. Considering a small $\mathrm{SU}(3)$ breaking, the $s$ quark momentum fraction here should be a little larger than that of the $u$ or $d$ quark in the lighter $B$ mesons, since the $s$ quark is heavier than the $u$ or $d$ quark. The shape of the distribution amplitude is shown in Fig 2 for $\omega_{B}=0.45 \mathrm{GeV}, 0.5 \mathrm{GeV}$, and 0.55 GeV . It is easy to see that the larger $\omega_{b}$ gives a larger momentum fraction to the $s$ quark. We will use $\omega_{b}=0.50 \pm 0.05 \mathrm{GeV}$ in this paper for the $B_{s}$ decays.

## C. Distribution Amplitudes of Light Pseudo-scalar Mesons

The decay constant $f_{P}$ of the pseudo-scalar meson is defined by the matrix element of the axial current:

$$
\begin{equation*}
\langle 0| \bar{q}_{1} \gamma_{\mu} \gamma_{5} q_{2}|P(P)\rangle=i f_{P} P_{\mu} \tag{16}
\end{equation*}
$$

FIG. 2: $\quad B_{s}$ meson distribution amplitudes. The solid-, dashed-, and tiny-dashed- lines correspond to $\omega_{B}=0.45 \mathrm{GeV}, 0.5 \mathrm{GeV}$, and 0.55 GeV .

$131160209 \pm 2165 \pm 9195 \pm 3145 \pm 10217 \pm 5185 \pm 10231 \pm 4200 \pm 10$

The pseudo-scalar decay constants are shown in table II taken from the Particle Data Group [28]. The vector meson longitudinal decay constants are extracted from the data on $\tau^{-} \rightarrow\left(\rho^{-}, K^{*-}\right) \nu_{\tau}$ [28] and the transverse decay constants are taken from QCD sum rules [29, 30]. The input values given in table $\Pi$ are very similar to the ones used in [16].

The light-cone distribution amplitudes are defined by the matrix elements of the non-local lightray operators at the light-like separation $z_{\mu}$ with $z^{2}=0$, and sandwiched between the vacuum and the meson state. The two-particle light-cone distribution amplitudes of an outgoing pseudo-scalar meson $P$, up to twist-3 accuracy, are defined by (31]:

$$
\begin{align*}
\langle P(P)| \bar{q}_{2}(z) \gamma_{\mu} \gamma_{5} q_{1}(0)|0\rangle & =-i f_{P} P_{\mu} \int_{0}^{1} d x e^{i x P \cdot z} \phi_{2}(x),  \tag{17}\\
\langle P(P)| \bar{q}_{2}(z) \gamma_{5} q_{1}(0)|0\rangle & =-i f_{P} m_{0} \int_{0}^{1} d x e^{i x P \cdot z} \phi_{3}^{P}(x)  \tag{18}\\
\langle P(P)| \bar{q}_{2}(z) \sigma_{\mu \nu} \gamma_{5} q_{1}(0)|0\rangle & =\frac{i}{6} f_{P} m_{0}\left(P_{\mu} z_{\nu}-P_{\nu} z_{\mu}\right) \int_{0}^{1} d x e^{i x P \cdot z} \phi_{3}^{\sigma}(x) . \tag{19}
\end{align*}
$$

where we have omitted the Wilson line connecting the two space-time points. $\phi_{2}(x), \phi_{3}^{P}(x)$ and $\phi_{3}^{\sigma}(x)$ have unit normalization. $M_{P}$ is the mass of the pseudo-scalar meson, $m_{0}$ is the chiral scale parameter which is defined using the meson mass and the quark masses as $m_{0}=\frac{M_{P}^{2}}{m_{q_{1}}+m_{q_{2}}}$ :
$m_{0}^{\pi}=1.4 \mathrm{GeV}$ and $m_{0}^{K}=1.9 \mathrm{GeV}, x$ is the momentum fraction associated with the quark $q_{2}$. It is easy to observe that the contribution from $\phi_{2}(x)$, independent of the mass, is twist- 2 . The contributions from $\phi_{3}^{P}(x)$ and $\phi_{3}^{\sigma}(x)$, proportional to $r=m_{0} / M_{B_{s}}$, are twist-3.

The above definitions can be collected as

$$
\begin{align*}
\langle P(P)| \bar{q}_{2 \beta}(z) q_{1 \alpha}(0)|0\rangle & =-\frac{i}{\sqrt{6}} \int_{0}^{1} d x e^{i x P \cdot z}\left[\gamma_{5} P P \phi^{A}(x)+m_{0} \gamma_{5} \phi^{P}(x)-m_{0} \sigma^{\mu \nu} \gamma_{5} P_{\mu} z_{\nu} \frac{\phi^{\sigma}(x)}{6}\right]_{\alpha \beta} \\
& =-\frac{i}{\sqrt{6}} \int_{0}^{1} d x e^{i x P \cdot z}\left[\gamma_{5} \not P \phi^{A}(x)+\gamma_{5} m_{0} \phi^{P}(x)+m_{0} \gamma_{5}(\npreceq \not \phi-1) \phi^{T}(x)\right]_{\alpha \beta} \tag{20}
\end{align*}
$$

with the redefinitions of the distribution amplitudes:

$$
\begin{equation*}
\phi^{A}(x)=\frac{f_{P}}{2 \sqrt{6}} \phi_{2}(x), \phi^{P}(x)=\frac{f_{P}}{2 \sqrt{6}} \phi_{3}^{P}(x), \quad \phi^{\sigma}(x)=\frac{f_{P}}{2 \sqrt{6}} \phi_{3}^{\sigma}(x), \tag{21}
\end{equation*}
$$

and we have performed the integration by parts for the third terms and $\phi^{T}(x)=\frac{1}{6} \frac{d}{d x} \phi^{\sigma}(x)$.
In the pQCD approach, the only non-perturbative inputs are the meson decay constants and meson light cone distribution amplitudes, and they are both channel independent. The meson decay constants are either measured through the leptonic decays of the mesons and the semileptonic decays of the $\tau$-lepton or calculated from the measured ones using broken $\mathrm{SU}(3)$ symmetry. Therefore there is not much uncertainty in them. The wave functions depend on the factorization scale and also the factorization scheme. In principle, they should be determined by experiment. Although there is no direct experimental measurement for the moments yet, the non-leptonic $B^{0}$ and $B^{ \pm}$decays already give much information on them [5, 33]. Since the pQCD approach gives very good results for these decays, especially the direct CP asymmetries in $B^{0} \rightarrow \pi^{+} \pi^{-}$and $B^{0} \rightarrow K^{+} \pi^{-}$decays [34], we will use the well constrained light cone distribution amplitudes of the mesons in these papers [31] (see [32] for a summary and update of the LCDAs):

$$
\begin{align*}
\phi_{\pi}^{A}(x) & =\frac{3 f_{\pi}}{\sqrt{6}} x(1-x)\left[1+0.44 C_{2}^{3 / 2}(t)\right],  \tag{22}\\
\phi_{\pi}^{P}(x) & =\frac{f_{\pi}}{2 \sqrt{6}}\left[1+0.43 C_{2}^{1 / 2}(t)\right],  \tag{23}\\
\phi_{\pi}^{T}(x) & =-\frac{f_{\pi}}{2 \sqrt{6}}\left[C_{1}^{1 / 2}(t)+0.55 C_{3}^{1 / 2}(t)\right],  \tag{24}\\
\phi_{K}^{A}(x) & =\frac{3 f_{K}}{\sqrt{6}} x(1-x)\left[1+0.17 C_{1}^{3 / 2}(t)+0.2 C_{2}^{3 / 2}(t)\right],  \tag{25}\\
\phi_{K}^{P}(x) & =\frac{f_{K}}{2 \sqrt{6}}\left[1+0.24 C_{2}^{1 / 2}(t)\right],  \tag{26}\\
\phi_{K}^{T}(x) & =-\frac{f_{K}}{2 \sqrt{6}}\left[C_{1}^{1 / 2}(t)+0.35 C_{3}^{1 / 2}(t)\right], \tag{27}
\end{align*}
$$

with Gegenbauer polynomials defined as:

$$
\begin{array}{ll}
C_{1}^{1 / 2}(t)=t, & C_{1}^{3 / 2}(t)=3 t \\
C_{2}^{1 / 2}(t)=\frac{1}{2}\left(3 t^{2}-1\right), & C_{2}^{3 / 2}(t)=\frac{3}{2}\left(5 t^{2}-1\right),  \tag{28}\\
C_{3}^{1 / 2}(t)=\frac{1}{2} t\left(5 t^{2}-3\right), &
\end{array}
$$

and $t=2 x-1$. In the LCDAs for $\phi_{\pi}^{A}(x), \phi_{\pi}^{P}(x)$ and $\phi_{K}^{P}(x)$, we have dropped the terms proportional to $C_{4}^{1 / 2,3 / 2}$, and take into account only the first two terms in their expansion, consistently with the rest of the LCDAs. These distribution amplitudes are very close to the previous QCD sum rule results 31. In recent years, there have been continuing updates of the light cone distribution amplitudes [35]. However, the changes in the coefficients of the Gegenbauer polynomials do not affect our results significantly, as shown in the next section. We also point out that the default value of the scale at which the Gegenbauer coefficients are given above is 1 GeV . However, the scale of the perturbative calculation in the pQCD approach where these LCDAs enter is typically 2 GeV . The LCDAs can be scaled up, as the required anomalous dimensions are known. We have done this and find that the resulting numerical differences are small. Strictly speaking, these differences are part of the NLO corrections. With the current theoretical accuracy, they can be absorbed in the uncertainties on the input Gegenbauer coefficients in the numerical calculations.

As for the mixing of $\eta$ and $\eta^{\prime}$, we use the quark flavor basis proposed by Feldmann, Kroll and Stech [36], i.e. these two mesons are made of $\bar{n} n=(\bar{u} u+\bar{d} d) / \sqrt{2}$ and $\bar{s} s$ :

$$
\begin{equation*}
\binom{|\eta\rangle}{\left|\eta^{\prime}\right\rangle}=U(\phi)\binom{\left|\eta_{n}\right\rangle}{\left|\eta_{s}\right\rangle}, \tag{29}
\end{equation*}
$$

with the matrix,

$$
U(\phi)=\left(\begin{array}{rr}
\cos \phi & -\sin \phi  \tag{30}\\
\sin \phi & \cos \phi
\end{array}\right)
$$

where the mixing angle $\phi=39.3^{\circ} \pm 1.0^{\circ}$. In principle, this mixing mechanism is equivalent to the singlet and octet formalism, as discussed in [36], and the advantage here is that explicitly only two decay constants are needed:

$$
\begin{align*}
\langle 0| \bar{n} \gamma^{\mu} \gamma_{5} n\left|\eta_{n}(P)\right\rangle & =\frac{i}{\sqrt{2}} f_{n} P^{\mu}, \\
\langle 0| \bar{s} \gamma^{\mu} \gamma_{5} s\left|\eta_{s}(P)\right\rangle & =i f_{s} P^{\mu} . \tag{31}
\end{align*}
$$

We assume that the distribution amplitudes of $\bar{n} n$ and $\bar{s} s$ are the same as the distribution amplitudes of $\pi$, except for the different decay constants and the chiral scale parameters. We
use 36

$$
\begin{equation*}
f_{n}=(1.07 \pm 0.02) f_{\pi}=139.1 \pm 2.6 \mathrm{MeV}, \quad f_{s}=(1.34 \pm 0.06) f_{\pi}=174.2 \pm 7.8 \mathrm{MeV} \tag{32}
\end{equation*}
$$

as the averaged results from the experimental data. The chiral enhancement factors are chosen as

$$
\begin{align*}
m_{0}^{\bar{n} n} & =\frac{1}{2 m_{n}}\left[m_{\eta}^{2} \cos ^{2} \phi+m_{\eta^{\prime}}^{2} \sin ^{2} \phi-\frac{\sqrt{2} f_{s}}{f_{n}}\left(m_{\eta^{\prime}}^{2}-m_{\eta}^{2}\right) \cos \phi \sin \phi\right],  \tag{33}\\
m_{0}^{\overline{5} s} & =\frac{1}{2 m_{s}}\left[m_{\eta^{\prime}}^{2} \cos ^{2} \phi+m_{\eta}^{2} \sin ^{2} \phi-\frac{f_{n}}{\sqrt{2} f_{s}}\left(m_{\eta^{\prime}}^{2}-m_{\eta}^{2}\right) \cos \phi \sin \phi\right] . \tag{34}
\end{align*}
$$

There are gluonic contributions which have been investigated in [37], with the result that these parts do not change the numerical results significantly. So, we will not consider this kind of contribution in this work.

## D. Distribution Amplitudes of Light Vector Mesons

We choose the vector meson momentum $P$ with $P^{2}=M_{V}^{2}$, which is mainly in the plus direction. The polarization vectors $\epsilon$, satisfying $P \cdot \epsilon=0$, include one longitudinal polarization vector $\epsilon_{L}$ and two transverse polarization vectors $\epsilon_{T}$. Following a similar procedure as for the pseudo-scalar mesons, we can derive the vector meson distribution amplitudes up to twist-3 [38]:

$$
\begin{align*}
\left\langle V\left(P, \epsilon_{L}^{*}\right)\right| \bar{q}_{2 \beta}(z) q_{1 \alpha}(0)|0\rangle= & \frac{1}{\sqrt{6}} \int_{0}^{1} d x e^{i x P \cdot z}\left[M_{V} \phi_{L}^{*} \phi_{V}(x)+\phi_{L}^{*} P \phi_{V}^{t}(x)+M_{V} \phi_{V}^{s}(x)\right]_{\alpha \beta}(3:  \tag{35}\\
\left\langle V\left(P, \epsilon_{T}^{*}\right)\right| \bar{q}_{2 \beta}(z) q_{1 \alpha}(0)|0\rangle= & \frac{1}{\sqrt{6}} \int_{0}^{1} d x e^{i x P \cdot z}\left[M_{V} \phi_{T}^{*} \phi_{V}^{v}(x)+\phi_{T}^{*} P \phi_{V}^{T}(x)\right. \\
& \left.+M_{V} i \epsilon_{\mu \nu \rho \sigma} \gamma_{5} \gamma^{\mu} \epsilon_{T}^{* \nu} n^{\rho} v^{\sigma} \phi_{V}^{a}(x)\right]_{\alpha \beta} \tag{36}
\end{align*}
$$

for longitudinal polarization and transverse polarization, respectively. Here $x$ is the momentum fraction associated with the $q_{2}$ quark. We adopt the convention $\epsilon^{0123}=1$ for the Levi-Civita tensor $\epsilon^{\mu \nu \alpha \beta}$.

The twist-2 distribution amplitudes for a longitudinally polarized vector meson can be parameterized as:

$$
\begin{align*}
\phi_{\rho}(x) & =\frac{3 f_{\rho}}{\sqrt{6}} x(1-x)\left[1+a_{2 \rho}^{\|} C_{2}^{3 / 2}(t)\right]  \tag{37}\\
\phi_{\omega}(x) & =\frac{3 f_{\omega}}{\sqrt{6}} x(1-x)\left[1+a_{2 \omega}^{\|} C_{2}^{3 / 2}(t)\right]  \tag{38}\\
\phi_{K^{*}}(x) & =\frac{3 f_{K^{*}}}{\sqrt{6}} x(1-x)\left[1+a_{1 K^{*}}^{\|} C_{1}^{3 / 2}(t)+a_{2 K^{*}}^{\|} C_{2}^{3 / 2}(t)\right]  \tag{39}\\
\phi_{\phi}(x) & =\frac{3 f_{\phi}}{\sqrt{6}} x(1-x)\left[1+a_{2 \phi}^{\|} C_{2}^{3 / 2}(t)\right] \tag{40}
\end{align*}
$$

Here $f_{V}$ is the decay constant of the vector meson with longitudinal polarization, whose values are shown in table II. The Gegenbauer moments have been studied extensively in the literatures [38, 39], here we adopt the following values from the recent updates [29, 30, 40]:

$$
\begin{equation*}
a_{1 K^{*}}^{\|}=0.03 \pm 0.02, \quad a_{2 \rho}^{\|}=a_{2 \omega}^{\|}=0.15 \pm 0.07, \quad a_{2 K^{*}}^{\|}=0.11 \pm 0.09, \quad a_{2 \phi}^{\|}=0.18 \pm 0.08 \tag{41}
\end{equation*}
$$

and we use the asymptotic form [41]:

$$
\begin{equation*}
\phi_{V}^{t}(x)=\frac{3 f_{V}^{T}}{2 \sqrt{6}} t^{2}, \quad \phi_{V}^{s}(x)=\frac{3 f_{V}^{T}}{2 \sqrt{6}}(-t) . \tag{42}
\end{equation*}
$$

The twist-2 transversely polarized distribution amplitudes $\phi_{V}^{T}$ have a similar form as the longitudinally polarized ones in eq.(37,40), with the moments [29, 30]:

$$
\begin{equation*}
a_{1 K^{*}}^{\perp}=0.04 \pm 0.03, \quad a_{2 \rho}^{\perp}=a_{2 \omega}^{\perp}=0.14 \pm 0.06, \quad a_{2 K^{*}}^{\perp}=0.10 \pm 0.08, \quad a_{2 \phi}^{\perp}=0.14 \pm 0.07 . \tag{43}
\end{equation*}
$$

The asymptotic form of the twist-3 distribution amplitudes $\phi_{V}^{v}$ and $\phi_{V}^{a}$ are

$$
\begin{equation*}
\phi_{V}^{v}(x)=\frac{3 f_{V}}{8 \sqrt{6}}\left(1+t^{2}\right), \quad \phi_{V}^{a}(x)=\frac{3 f_{V}}{4 \sqrt{6}}(-t) \tag{44}
\end{equation*}
$$

The above choices of vector meson distribution amplitudes can essentially explain the measured $B \rightarrow K^{*} \phi, B \rightarrow K^{*} \rho$ and $B \rightarrow \rho \rho$ polarization fractions [41, 42, 43, 44], together with the right branching ratios.

## E. A Brief Review of the pQCD Approach

The basic idea of the pQCD approach is that it takes into account the transverse momentum of the valence quarks in the hadrons which results in the Sudakov factor in the decay amplitude. As an example, taking the first diagram in Fig. 3, the emitted particle $M_{2}$ in the decay can be factored out (in terms of the appropriate vacuum to $M_{2}$ transition matrix element) and the rest of the amplitude can be expressed as the convolution of the wave functions $\phi_{B_{s}}, \phi_{M_{3}}$ and the hard scattering kernel $T_{H}$, integrated over the longitudinal and the transverse momenta. Thus,

$$
\begin{equation*}
\mathcal{M} \propto \int_{0}^{1} d x_{1} d x_{3} \int \frac{d^{2} \vec{k}_{1 T}}{(2 \pi)^{2}} \frac{d^{2} \vec{k}_{3 T}}{(2 \pi)^{2}} \phi_{B}\left(x_{1}, \vec{k}_{1 T}, p_{1}, t\right) T_{H}\left(x_{1}, x_{3}, \vec{k}_{1 T}, \vec{k}_{3 T}, t\right) \phi_{V}\left(x_{3}, \vec{k}_{3 T}, p_{3}, t\right) \tag{45}
\end{equation*}
$$

It is convenient to calculate the decay amplitude in coordinate space. Through the Fourier transformation, the above equation can be expressed as:

$$
\begin{equation*}
\mathcal{M} \propto \int_{0}^{1} d x_{1} d x_{3} \int d^{2} \vec{b}_{1} d^{2} \vec{b}_{3} \phi_{B}\left(x_{1}, \vec{b}_{1}, p_{1}, t\right) T_{H}\left(x_{1}, x_{3}, \vec{b}_{1}, \vec{b}_{3}, t\right) \phi_{V}\left(x_{3}, \vec{b}_{3}, p_{3}, t\right) \tag{46}
\end{equation*}
$$

Loop effects can, in principle, be taken into account in the above expression. In general, individual higher order diagrams suffer from two types of infrared divergences: soft and collinear. Soft divergence arise from the region of a loop momentum where all it's components in the light-cone coordinate vanish:

$$
\begin{equation*}
l^{\mu}=\left(l^{+}, l^{-}, \vec{l}_{T}\right)=(\Lambda, \Lambda, \vec{\Lambda}) \tag{47}
\end{equation*}
$$

Collinear divergence originates from the gluon momentum region which is parallel to the massless quark momentum,

$$
\begin{equation*}
l^{\mu}=\left(l^{+}, l^{-}, \vec{l}_{T}\right) \sim\left(m_{B}, \Lambda^{2} / m_{B}, \vec{\Lambda}\right) \tag{48}
\end{equation*}
$$

In both cases, the loop integration corresponds to $\int d^{4} l / l^{4} \sim \log \Lambda$, so logarithmic divergences are generated. It has been shown order by order in perturbation theory that these divergences can be separated from the hard perturbative kernel and absorbed into the meson wave functions using the eikonal approximation [45] . One also encounters double logarithm divergences when soft and collinear momenta overlap. These large double logarithm can be re-summed into the Sudakov factor and the explicit form is given in Appendix A.

Loop corrections to the weak decay vertex also give rise to double logarithms. For example, the first diagram in Fig. 3 gives an amplitude proportional to $1 /\left(x_{3}^{2} x_{1}\right)$. In the threshold region with $x_{3} \rightarrow 0$, additional collinear divergences are associated with the internal quark. The QCD loop corrections to the weak vertex can produce the double logarithm $\alpha_{s} \ln ^{2} x_{3}$ and the re-summation of this type of double logarithms leads to the Sudakov factor $S_{t}\left(x_{3}\right)$. Similarly, the re-summation of $\alpha_{s} \ln ^{2} x_{1}$ due to loop corrections in the other diagram lead to the Sudakov factor $S_{t}\left(x_{1}\right)$. These double logarithm can also be factored out from the hard part and grouped into the quark jet function [46]. This type of factor decreases faster than any power of $x$ as $x \rightarrow 0$, so it removes the endpoint singularity. For simplicity, this factor has been parameterized in a form which is independent of the decay channels, twist and flavors [47].

Combining all the elements together, the typical factorization formula in the PQCD approach reads as:

$$
\begin{align*}
\mathcal{M} \propto & \int_{0}^{1} d x_{1} d x_{3} \int d^{2} \vec{b}_{1} d^{2} \vec{b}_{3} \phi_{B}\left(x_{1}, \vec{b}_{1}, p_{1}, t\right) \\
& \times T_{H}\left(x_{1}, x_{3}, \vec{b}_{1}, \vec{b}_{3}, t\right) \phi_{M_{3}}\left(x_{3}, \vec{b}_{3}, p_{3}, t\right) S_{t}\left(x_{3}\right) \exp \left[-S_{B}(t)-S_{3}(t)\right] \tag{49}
\end{align*}
$$

The threshold Sudakov function $S_{t}\left(x_{3}\right)$ and the Sudakov exponents $S_{B}(t), S_{2}(t)$ and $S_{3}(t)$ are given in Appendix A. Again, strictly speaking, the Sudakov improvements result from higher

FIG. 3: The Feynman diagrams for emission contribution, with possible four-quark operator insertions order contributions. However, they are included traditionally in the PQCD approach, though in most applications, the perturbative function $T_{H}\left(x_{1}, x_{3}, \vec{b}_{1}, \vec{b}_{3}, t\right) \phi_{M_{3}}\left(x_{3}, \vec{b}_{3}, p_{3}, t\right)$ is calculated only in the leading order in $\alpha_{s}$.

## III. CALCULATION OF THE $B_{s} \rightarrow P P$ DECAY AMPLITUDES IN THE PQCD AP-

 PROACHIn the following we will give the general factorization formulae for $\bar{B}_{s} \rightarrow P P$ decays, and the pQCD functions can be found in Appendix A. We will use $L L$ to denote the contribution from $(V-A)(V-A)$ operators, $L R$ to denote the contribution from $(V-A)(V+A)$ operators and $S P$ to denote the contribution from $(S-P)(S+P)$ operators which result from the Fierz transformation of the $(V-A)(V+A)$ operators.

## A. Emission Diagram

The emission diagrams are depicted in Figure 3. The first two diagrams are called factorizable. They will give the $B \rightarrow M_{3}$ decay form factor, if we factor out the corresponding Wilson coefficients $a_{i}$.

- $(V-A)(V-A)$ operators:

$$
\begin{align*}
f_{M_{2}} F_{B_{s} \rightarrow M_{3}}^{L L}\left(a_{i}\right)= & 8 \pi C_{F} M_{B_{s}}^{4} f_{M_{2}} \int_{0}^{1} d x_{1} d x_{3} \int_{0}^{\infty} b_{1} d b_{1} b_{3} d b_{3} \phi_{B_{s}}\left(x_{1}, b_{1}\right)\left\{a_{i}\left(t_{a}\right) E_{e}\left(t_{a}\right)\right. \\
& \times\left[\left(1+x_{3}\right) \phi_{3}^{A}\left(x_{3}\right)+r_{3}\left(1-2 x_{3}\right)\left(\phi_{3}^{P}\left(x_{3}\right)+\phi_{3}^{T}\left(x_{3}\right)\right)\right] h_{e}\left(x_{1}, x_{3}, b_{1}, b_{3}\right) \\
& \left.+2 r_{3} \phi_{3}^{P}\left(x_{3}\right) a_{i}\left(t_{a}^{\prime}\right) E_{e}\left(t_{a}^{\prime}\right) h_{e}\left(x_{3}, x_{1}, b_{3}, b_{1}\right)\right\} \tag{50}
\end{align*}
$$

- $(V-A)(V+A)$ operators:

$$
\begin{equation*}
F_{B_{s} \rightarrow M_{3}}^{L R}\left(a_{i}\right)=-F_{B_{s} \rightarrow M_{3}}^{L L}\left(a_{i}\right), \tag{51}
\end{equation*}
$$

- $(S-P)(S+P)$ operators:

$$
\begin{align*}
f_{M_{2}} F_{B_{s} \rightarrow M_{3}}^{S P}\left(a_{i}\right)= & 16 \pi r_{2} C_{F} M_{B_{s}}^{4} f_{M_{2}} \int_{0}^{1} d x_{1} d x_{3} \int_{0}^{\infty} b_{1} d b_{1} b_{3} d b_{3} \phi_{B_{s}}\left(x_{1}, b_{1}\right)\left\{a_{i}\left(t_{a}\right) E_{e}\left(t_{a}\right)\right. \\
& \times\left[\phi_{3}^{A}\left(x_{3}\right)+r_{3}\left(2+x_{3}\right) \phi_{3}^{P}\left(x_{3}\right)-r_{3} x_{3} \phi_{3}^{T}\left(x_{3}\right)\right] h_{e}\left(x_{1}, x_{3}, b_{1}, b_{3}\right) \\
& \left.+2 r_{3} \phi_{3}^{P}\left(x_{3}\right) a_{i}\left(t_{a}^{\prime}\right) E_{e}\left(t_{a}^{\prime}\right) h_{e}\left(x_{3}, x_{1}, b_{3}, b_{1}\right)\right\} \tag{52}
\end{align*}
$$

with $C_{F}=4 / 3$ and $a_{i}$ the corresponding Wilson coefficients for specific channels. In the above functions, $r_{i}=m_{0 i} / m_{B_{s}}$, where $m_{0 i}$ is the chiral scale parameter. The functions $E_{i}$, the definitions of the factorization scales $t_{i}$ and the hard functions $h_{i}$ are given in Appendix $\mathbb{A}$.

The last two diagrams in Fig.3 (c)(d) are the non-factorizable diagrams, whose contributions are

- $(V-A)(V-A)$ operators:

$$
\begin{align*}
M_{B_{s} \rightarrow M_{3}}^{L L}\left(a_{i}\right)= & 32 \pi C_{F} M_{B_{s}}^{4} / \sqrt{6} \int_{0}^{1} d x_{1} d x_{2} d x_{3} \int_{0}^{\infty} b_{1} d b_{1} b_{2} d b_{2} \phi_{B_{s}}\left(x_{1}, b_{1}\right) \phi_{2}^{A}\left(x_{2}\right) \\
& \times\left\{\left[\left(1-x_{2}\right) \phi_{3}^{A}\left(x_{3}\right)-r_{3} x_{3}\left(\phi_{3}^{P}\left(x_{3}\right)-\phi_{3}^{T}\left(x_{3}\right)\right)\right] a_{i}\left(t_{b}\right) E_{e}^{\prime}\left(t_{b}\right)\right. \\
& \times h_{n}\left(x_{1}, 1-x_{2}, x_{3}, b_{1}, b_{2}\right)+h_{n}\left(x_{1}, x_{2}, x_{3}, b_{1}, b_{2}\right) \\
& \left.\times\left[-\left(x_{2}+x_{3}\right) \phi_{3}^{A}\left(x_{3}\right)+r_{3} x_{3}\left(\phi_{3}^{P}\left(x_{3}\right)+\phi_{3}^{T}\left(x_{3}\right)\right)\right] a_{i}\left(t_{b}^{\prime}\right) E_{e}^{\prime}\left(t_{b}^{\prime}\right)\right\}, \tag{53}
\end{align*}
$$

- $(V-A)(V+A)$ operators:

$$
\begin{align*}
M_{B_{s} \rightarrow M_{3}}^{L R}\left(a_{i}\right)= & 32 \pi C_{F} M_{B_{s}}^{4} r_{2} / \sqrt{6} \int_{0}^{1} d x_{1} d x_{2} d x_{3} \int_{0}^{\infty} b_{1} d b_{1} b_{2} d b_{2} \phi_{B_{s}}\left(x_{1}, b_{1}\right) \\
& \times\left\{h _ { n } ( x _ { 1 } , 1 - x _ { 2 } , x _ { 3 } , b _ { 1 } , b _ { 2 } ) \left[\left(1-x_{2}\right) \phi_{3}^{A}\left(x_{3}\right)\left(\phi_{2}^{P}\left(x_{2}\right)+\phi_{2}^{T}\left(x_{2}\right)\right)\right.\right. \\
& +r_{3} x_{3}\left(\phi_{2}^{P}\left(x_{2}\right)-\phi_{2}^{T}\left(x_{2}\right)\right)\left(\phi_{3}^{P}\left(x_{3}\right)+\phi_{3}^{T}\left(x_{3}\right)\right) \\
& \left.+\left(1-x_{2}\right) r_{3}\left(\phi_{2}^{P}\left(x_{2}\right)+\phi_{2}^{T}\left(x_{2}\right)\right)\left(\phi_{3}^{P}\left(x_{3}\right)-\phi_{3}^{T}\left(x_{3}\right)\right)\right] a_{i}\left(t_{b}\right) E_{e}^{\prime}\left(t_{b}\right) \\
& -h_{n}\left(x_{1}, x_{2}, x_{3}, b_{1}, b_{2}\right)\left[x_{2} \phi_{3}^{A}\left(x_{3}\right)\left(\phi_{2}^{P}\left(x_{2}\right)-\phi_{2}^{T}\left(x_{2}\right)\right)\right. \\
& +r_{3} x_{2}\left(\phi_{2}^{P}\left(x_{2}\right)-\phi_{2}^{T}\left(x_{2}\right)\right)\left(\phi_{3}^{P}\left(x_{3}\right)-\phi_{3}^{T}\left(x_{3}\right)\right) \\
& \left.\left.+r_{3} x_{3}\left(\phi_{2}^{P}\left(x_{2}\right)+\phi_{2}^{T}\left(x_{2}\right)\right)\left(\phi_{3}^{P}\left(x_{3}\right)+\phi_{3}^{T}\left(x_{3}\right)\right)\right] a_{i}\left(t_{b}^{\prime}\right) E_{e}^{\prime}\left(t_{b}^{\prime}\right)\right\}, \tag{54}
\end{align*}
$$

FIG. 4: The Feynman diagrams for annihilation contribution, with possible four-quark operator insertions

- $(S-P)(S+P)$ operators:

$$
\begin{align*}
M_{B_{s} \rightarrow M_{3}}^{S P}\left(a_{i}\right)= & 32 \pi C_{F} M_{B_{s}}^{4} / \sqrt{6} \int_{0}^{1} d x_{1} d x_{2} d x_{3} \int_{0}^{\infty} b_{1} d b_{1} b_{2} d b_{2} \phi_{B_{s}}\left(x_{1}, b_{1}\right) \phi_{2}^{A}\left(x_{2}\right) \\
& \times\left\{\left[\left(x_{2}-x_{3}-1\right) \phi_{3}^{A}\left(x_{3}\right)+r_{3} x_{3}\left(\phi_{3}^{P}\left(x_{3}\right)+\phi_{3}^{T}\left(x_{3}\right)\right)\right]\right. \\
& \times a_{i}\left(t_{b}\right) E_{e}^{\prime}\left(t_{b}\right) h_{n}\left(x_{1}, 1-x_{2}, x_{3}, b_{1}, b_{2}\right)+a_{i}\left(t_{b}^{\prime}\right) E_{e}^{\prime}\left(t_{b}^{\prime}\right) \\
& \left.\times\left[x_{2} \phi_{3}^{A}\left(x_{3}\right)+r_{3} x_{3}\left(\phi_{3}^{T}\left(x_{3}\right)-\phi_{3}^{P}\left(x_{3}\right)\right)\right] h_{n}\left(x_{1}, x_{2}, x_{3}, b_{1}, b_{2}\right)\right\} . \tag{55}
\end{align*}
$$

From these formulas we can see that there are cancellations between the two diagrams of Fig.3 (c) and (d). If the Wilson coefficients are the same, the non-factorizable contributions (proportional to the small $x_{i}$ ) are power suppressed compared to the factorizable emission diagram contributions in eq. (50-52).

## B. Annihilation type Diagrams

We group all the W annihilation and W -exchange, space-like penguin and time-like penguin annihilation diagrams together and refer to them as the annihilation type diagrams. In Fig. 4 , the first two diagrams are the factorizable annihilation diagrams, whose contributions are

- $(V-A)(V-A)$ operators:

$$
\begin{align*}
f_{B_{s}} F_{a n n}^{L L}\left(a_{i}\right)= & 8 \pi C_{F} M_{B_{s}}^{4} f_{B_{s}} \int_{0}^{1} d x_{2} d x_{3} \int_{0}^{\infty} b_{2} d b_{2} b_{3} d b_{3}\left\{a_{i}\left(t_{c}\right) E_{a}\left(t_{c}\right)\right. \\
& \times\left[\left(x_{3}-1\right) \phi_{2}^{A}\left(x_{2}\right) \phi_{3}^{A}\left(x_{3}\right)-4 r_{2} r_{3} \phi_{2}^{P}\left(x_{2}\right) \phi_{3}^{P}\left(x_{3}\right)\right. \\
& \left.+2 r_{2} r_{3} x_{3} \phi_{2}^{P}\left(x_{2}\right)\left(\phi_{3}^{P}\left(x_{3}\right)-\phi_{3}^{T}\left(x_{3}\right)\right)\right] h_{a}\left(x_{2}, 1-x_{3}, b_{2}, b_{3}\right) \\
& +\left[x_{2} \phi_{2}^{A}\left(x_{2}\right) \phi_{3}^{A}\left(x_{3}\right)+2 r_{2} r_{3}\left(\phi_{2}^{P}\left(x_{2}\right)-\phi_{2}^{T}\left(x_{2}\right)\right) \phi_{3}^{P}\left(x_{3}\right)\right. \\
& \left.\left.+2 r_{2} r_{3} x_{2}\left(\phi_{2}^{P}\left(x_{2}\right)+\phi_{2}^{T}\left(x_{2}\right)\right) \phi_{3}^{P}\left(x_{3}\right)\right] a_{i}\left(t_{c}^{\prime}\right) E_{a}\left(t_{c}^{\prime}\right) h_{a}\left(1-x_{3}, x_{2}, b_{3}, b_{2}\right)\right\} . \tag{56}
\end{align*}
$$

There is a big cancellation between the two factorizable diagrams Fig.4(a) and (b), such that they are highly power suppressed, which agrees with the long time argument that the annihilation contributions are negligible. Especially, if the two final state mesons are identical, the formula of eq.(56) gives exactly zero.

- $(V-A)(V+A)$ operators:

$$
\begin{equation*}
F_{a n n}^{L R}\left(a_{i}\right)=F_{a n n}^{L L}\left(a_{i}\right), \tag{57}
\end{equation*}
$$

- $(S-P)(S+P)$ operators:

$$
\begin{align*}
f_{B_{s}} F_{a n n}^{S P}\left(a_{i}\right)= & 16 \pi C_{F} M_{B_{s}}^{4} f_{B_{s}} \int_{0}^{1} d x_{2} d x_{3} \int_{0}^{\infty} b_{2} d b_{2} b_{3} d b_{3}\left\{\left[2 r_{2} \phi_{2}^{P}\left(x_{2}\right) \phi_{3}^{A}\left(x_{3}\right)\right.\right. \\
& \left.+\left(1-x_{3}\right) r_{3} \phi_{2}^{A}\left(x_{2}\right)\left(\phi_{3}^{P}\left(x_{3}\right)+\phi_{3}^{T}\left(x_{3}\right)\right)\right] a_{i}\left(t_{c}\right) E_{a}\left(t_{c}\right) h_{a}\left(x_{2}, 1-x_{3}, b_{2}, b_{3}\right) \\
& +\left[2 r_{3} \phi_{2}^{A}\left(x_{2}\right) \phi_{3}^{P}\left(x_{3}\right)+r_{2} x_{2}\left(\phi_{2}^{P}\left(x_{2}\right)-\phi_{2}^{T}\left(x_{2}\right)\right) \phi_{3}^{A}\left(x_{3}\right)\right] \\
& \left.\times a_{i}\left(t_{c}^{\prime}\right) E_{a}\left(t_{c}^{\prime}\right) h_{a}\left(1-x_{3}, x_{2}, b_{3}, b_{2}\right)\right\} . \tag{58}
\end{align*}
$$

It is interesting to see that the two diagrams Fig.4 (a) and (b) give constructive contributions here. Furthermore, they are not power suppressed as the $(V-A)(V-A)$ operator contribution in eq.(56) (proportional to the small $x_{i}$ ), but proportional to $2 r_{2}$ or $2 r_{3}$. This gives the chirally enhanced contributions in the annihilation type diagrams. The operator $O_{6}$-induced space-like penguin contributions produce a large strong phase, which is essential to explain the large direct CP asymmetry in the $B^{0} \rightarrow \pi^{+} \pi^{-}$and $B^{0} \rightarrow K^{+} \pi^{-}$decays [34].

The last two diagrams in Fig[4 are the non-factorizable annihilation diagrams, whose contributions are

- $(V-A)(V-A)$ operators:

$$
\begin{align*}
M_{a n n}^{L L}\left(a_{i}\right)= & 32 \pi C_{F} M_{B_{s}}^{4} / \sqrt{6} \int_{0}^{1} d x_{1} d x_{2} d x_{3} \int_{0}^{\infty} b_{1} d b_{2} b_{2} d b_{2} \phi_{B_{s}}\left(x_{1}, b_{1}\right) \\
& \times\left\{h _ { n a } ( x _ { 1 } , x _ { 2 } , x _ { 3 } , b _ { 1 } , b _ { 2 } ) \left[-x_{2} \phi_{2}^{A}\left(x_{2}\right) \phi_{3}^{A}\left(x_{3}\right)-4 r_{2} r_{3} \phi_{2}^{P}\left(x_{2}\right) \phi_{3}^{P}\left(x_{3}\right)\right.\right. \\
& +r_{2} r_{3}\left(1-x_{2}\right)\left(\phi_{2}^{P}\left(x_{2}\right)+\phi_{2}^{T}\left(x_{2}\right)\right)\left(\phi_{3}^{P}\left(x_{3}\right)-\phi_{3}^{T}\left(x_{3}\right)\right) \\
& \left.+r_{2} r_{3} x_{3}\left(\phi_{2}^{P}\left(x_{2}\right)-\phi_{2}^{T}\left(x_{2}\right)\right)\left(\phi_{3}^{P}\left(x_{3}\right)+\phi_{3}^{T}\left(x_{3}\right)\right)\right] a_{i}\left(t_{d}\right) E_{a}^{\prime}\left(t_{d}\right) \\
& +h_{n a}^{\prime}\left(x_{1}, x_{2}, x_{3}, b_{1}, b_{2}\right)\left[\left(1-x_{3}\right) \phi_{2}^{A}\left(x_{2}\right) \phi_{3}^{A}\left(x_{3}\right)\right. \\
& +\left(1-x_{3}\right) r_{2} r_{3}\left(\phi_{2}^{P}\left(x_{2}\right)+\phi_{2}^{T}\left(x_{2}\right)\right)\left(\phi_{3}^{P}\left(x_{3}\right)-\phi_{3}^{T}\left(x_{3}\right)\right) \\
& \left.\left.+x_{2} r_{2} r_{3}\left(\phi_{2}^{P}\left(x_{2}\right)-\phi_{2}^{T}\left(x_{2}\right)\right)\left(\phi_{3}^{P}\left(x_{3}\right)+\phi_{3}^{T}\left(x_{3}\right)\right)\right] a_{i}\left(t_{d}^{\prime}\right) E_{a}^{\prime}\left(t_{d}^{\prime}\right)\right\} \tag{59}
\end{align*}
$$

- $(V-A)(V+A)$ operators:

$$
\begin{align*}
M_{a n n}^{L R}\left(M_{2}, M_{3}, a_{i}\right)= & 32 \pi C_{F} M_{B_{s}}^{4} / \sqrt{6} \int_{0}^{1} d x_{1} d x_{2} d x_{3} \int^{\infty} b_{1} d b_{1} b_{2} d b_{2} \phi_{B_{s}}\left(x_{1}, b_{1}\right) \\
& \times\left\{h _ { n a } ( x _ { 1 } , x _ { 2 } , x _ { 3 } , b _ { 1 } , b _ { 2 } ) \left[r_{2}\left(2-x_{2}\right)\left(\phi_{2}^{P}\left(x_{2}\right)+\phi_{2}^{T}\left(x_{2}\right)\right) \phi_{3}^{A}\left(x_{3}\right)\right.\right. \\
& \left.-r_{3}\left(1+x_{3}\right) \phi_{2}^{A}\left(x_{2}\right)\left(\phi_{3}^{P}\left(x_{3}\right)-\phi_{3}^{T}\left(x_{3}\right)\right)\right] a_{i}\left(t_{d}\right) E_{a}^{\prime}\left(t_{d}\right) \\
& +h_{n a}^{\prime}\left(x_{1}, x_{2}, x_{3}, b_{1}, b_{2}\right)\left[r_{2} x_{2}\left(\phi_{2}^{P}\left(x_{2}\right)+\phi_{2}^{T}\left(x_{2}\right)\right) \phi_{3}^{A}\left(x_{3}\right)\right. \\
& \left.\left.+r_{3}\left(x_{3}-1\right) \phi_{2}^{A}\left(x_{2}\right)\left(\phi_{3}^{P}\left(x_{3}\right)-\phi_{3}^{T}\left(x_{3}\right)\right)\right] a_{i}\left(t_{d}^{\prime}\right) E_{a}^{\prime}\left(t_{d}^{\prime}\right)\right\}, \tag{60}
\end{align*}
$$

- $(S-P)(S+P)$ operators:

$$
\begin{align*}
M_{a n n}^{S P}\left(a_{i}\right)= & 32 \pi C_{F} M_{B_{s}}^{4} / \sqrt{6} \int_{0}^{1} d x_{1} d x_{2} d x_{3} \int_{0}^{\infty} b_{1} d b_{1} b_{2} d b_{2} \phi_{B_{s}}\left(x_{1}, b_{1}\right) \\
& \times\left\{a _ { i } ( t _ { d } ) E _ { a } ^ { \prime } ( t _ { d } ) h _ { n a } ( x _ { 1 } , x _ { 2 } , x _ { 3 } , b _ { 1 } , b _ { 2 } ) \left[\left(x_{3}-1\right) \phi_{2}^{A}\left(x_{2}\right) \phi_{3}^{A}\left(x_{3}\right)\right.\right. \\
& -4 r_{2} r_{3} \phi_{2}^{P}\left(x_{2}\right) \phi_{3}^{P}\left(x_{3}\right)+r_{2} r_{3} x_{3}\left(\phi_{2}^{P}\left(x_{2}\right)+\phi_{2}^{T}\left(x_{2}\right)\right)\left(\phi_{3}^{P}\left(x_{3}\right)-\phi_{3}^{T}\left(x_{3}\right)\right) \\
& \left.+r_{2} r_{3}\left(1-x_{2}\right)\left(\phi_{2}^{P}\left(x_{2}\right)-\phi_{2}^{T}\left(x_{2}\right)\right)\left(\phi_{3}^{P}\left(x_{3}\right)+\phi_{3}^{T}\left(x_{3}\right)\right)\right] \\
& +a_{i}\left(t_{d}^{\prime}\right) E_{a}^{\prime}\left(t_{d}^{\prime}\right) h_{n a}^{\prime}\left(x_{1}, x_{2}, x_{3}, b_{1}, b_{2}\right)\left[x_{2} \phi_{2}^{A}\left(x_{2}\right) \phi_{3}^{A}\left(x_{3}\right)\right. \\
& \left.+x_{2} r_{2} r_{3}\left(\phi_{2}^{P}\left(x_{2}\right)+\phi_{2}^{T}\left(x_{2}\right)\right)\left(\phi_{3}^{P}\left(x_{3}\right)-\phi_{3}^{T}\left(x_{3}\right)\right)\right) \\
& \left.\left.+r_{2} r_{3}\left(1-x_{3}\right)\left(\phi_{2}^{P}\left(x_{2}\right)-\phi_{2}^{T}\left(x_{2}\right)\right)\left(\phi_{3}^{P}\left(x_{3}\right)+\phi_{3}^{T}\left(x_{3}\right)\right)\right]\right\} . \tag{61}
\end{align*}
$$

They are all power suppressed compared to the factorizable emission diagrams.

## C. Results for $B_{s} \rightarrow P P$ decays

First we give the numerical results in the pQCD approach for the form factors at maximal recoil. For the form factors, we obtain:

$$
\begin{align*}
F_{0}^{B \rightarrow \pi} & =0.23_{-0.04-0.00}^{+0.05+0.00}, \quad F_{0}^{B \rightarrow K}=0.28_{-0.05-0.00}^{+0.06+0.00},  \tag{62}\\
F_{0}^{B_{s} \rightarrow K} & =0.24_{-0.04-0.01}^{+0.05+0.00}, \tag{63}
\end{align*}
$$

where $f_{B}=0.19 \pm 0.02 \mathrm{GeV}, \omega_{B}=0.40 \mathrm{GeV}$ (for the $B^{ \pm}$and $B_{d}^{0}$ mesons) and $f_{B_{s}}=0.23 \pm 0.02$ $\mathrm{GeV}, \omega_{B_{s}}=0.50 \pm 0.05 \mathrm{GeV}$ (for the $B_{s}^{0}$ meson) have been used. They quantify the $\mathrm{SU}(3)-$ symmetry breaking effects in the form factors in the pQCD approach. The input values for $f_{B}$ and $f_{B_{s}}$ are in agreement with the unquenched lattice results [48] $f_{B}=0.216 \pm 0.022 \mathrm{GeV}$ and $f_{B_{s}}=0.259 \pm 0.032 \mathrm{GeV}$, and with the results from the QCD sum rules [49, 50]. We also mention in passing that a recent calculation of the distribution amplitudes for the pion and kaon with the QCD sum rules [51], which includes a new logarithmic divergent term in the twist-3 distribution amplitudes, leads to very large $\mathrm{SU}(3)$-breaking effects in the form factors, calculating the form factors in the standard pQCD approach [52]. This has also been observed in [27]. Whether this feature also emerges in the light-cone sum rule approach is not clear to us.

For the CKM matrix elements, we adopt the updated results from [53] and drop the (small) errors on $V_{u d}, V_{u s}, V_{t s}$ and $V_{t b}$ :

$$
\begin{array}{lll}
\left|V_{u d}\right|=0.974, & \left|V_{u s}\right|=0.226, & \left|V_{u b}\right|=\left(3.68_{-0.08}^{+0.11}\right) \times 10^{-3}, \\
\left|V_{t d}\right|=\left(8.20_{-0.27}^{+0.59}\right) \times 10^{-3}, & \left|V_{t s}\right|=40.96 \times 10^{-3}, & \left|V_{t b}\right|=1.0,  \tag{64}\\
\alpha=\left(99_{-9.4}^{+4}\right)^{\circ}, & \gamma=\left(59.0_{-3.7}^{+9.7}\right)^{\circ}, & \arg \left[-V_{t s} V_{t b}^{*}\right]=1.0^{\circ} .
\end{array}
$$

The CKM factors mostly give an overall factor to the branching ratios. However, the CKM angles do give large uncertainties to the branching ratios of some decays and to all the non-zero CP asymmetries. We will discuss their effects separately.

The formulas of the decay amplitudes for the various channels in terms of above topologies are given in Appendix (B) The $C P$-averaged branching ratios of $B_{s} \rightarrow P P$ decays are listed in Table III. The dominant topologies contributing to these decays are also indicated through the symbols $T$ (tree), $P$ (penguin), $P_{\mathrm{EW}}$ (electroweak penguins), $C$ (color-suppressed tree), and ann (annihilation). The first error in these entries arises from the input hadronic parameters, which is dominated by the $B_{s}$-meson decay constant (taken as $f_{B_{s}}=0.23 \pm 0.02 \mathrm{GeV}$ ) and the $B_{s}$ meson wave function shape parameter ( taken as $\omega_{b}=0.50 \pm 0.05 \mathrm{GeV}$ ). The second error is from the

TABLE III: The $C P$-averaged branching ratios $\left(\times 10^{-6}\right)$ of $B_{s} \rightarrow P P$ decays obtained in the pQCD approach (This work); the errors for these entries correspond to the uncertainties in the input hadronic quantities, from the scale-dependence, and the CKM matrix elements, respectively. We have also listed the current experimental measurements and upper limits ( $90 \%$ C.L.) wherever available [13]. For comparison, we also cite the theoretical estimates of the branching ratios in the QCD factorization framework [16], and in SCET [20], quoting two estimates in the latter case for some decays.

hard scale $t$, defined in Eqs. (A1) - (A8) in Appendix A, which we vary from $0.75 t$ to $1.25 t$, and from $\Lambda_{Q C D}^{(5)}=0.25 \pm 0.05 \mathrm{GeV}$. The scale-dependent uncertainty can be reduced only if the next-to-leading order contributions in the pQCD approach are known. A part of this perturbative improvement coming from the Wilson coefficients in the NLO approximation can be implemented already. However, the complete NLO corrections to the hard spectator kernels are still missing. The third error is the combined uncertainty in the CKM matrix elements and the angles of the unitarity triangle.

For comparison, we also reproduce verbatim the corresponding numerical results evaluated in the framework of the QCD factorization (QCDF) [16], and the ones obtained using the Soft-Collinear-Effective-Theory (SCET) [20]. For the decays $B_{s}^{0} \rightarrow P P$ involving an $\eta$ - and/or an $\eta^{\prime}-$ meson, Ref. [20] quotes two sets of values, which differ in the input values of the SCET parameters specific to the iso-singlet modes, describing gluonic contributions to the $B \rightarrow \eta^{(1)}$ form factors and the gluonic parts of the charming penguins. They are not too different from each other except for the electroweak-penguin-dominated decay $\overline{B_{s}^{0}} \rightarrow \pi^{0} \eta^{\prime}$. The errors quoted in the QCDF case correspond, respectively, to the assumed variation of the CKM parameters, variation of the renormalization scales, quark masses, decay constants, form factors and (whenever applicable) the $\eta-\eta^{\prime}$ mixing angle (collectively called "hadronic 1 "), uncertainties in the expansion of the light-cone distribution amplitudes (called "hadronic 2"), and estimates of the power corrections. The errors shown in the case of the SCET-based results are due to the estimates of the SU(3)breaking, $1 / m_{b}$ corrections and the errors on the SCET-parameters. The last column gives the current experimental data from the CDF collaboration [12, 13], and the upper limits correspond to $90 \%$ C.L.

A number of remarks on the entries in Table III is in order. We note that there is general agreement among these methods in the tree and penguin-dominated $B_{s}^{0} \rightarrow P P$ decays, with the variations reflecting essentially the differences in the input quantities. This agreement is less marked for the color-suppressed and electroweak-penguin dominated decays. For the annihilation dominated decays, SCET has no predictions and QCDF has essentially no predictive power as indicated by the estimates for the decays $\overline{B_{s}^{0}} \rightarrow \pi^{+} \pi^{-}$and $\overline{B_{s}^{0}} \rightarrow \pi^{0} \pi^{0}$, which vary over more than an order of magnitude once the parametric uncertainties are taken into account. First measurements of the tree-dominated decay $\overline{B_{s}^{0}} \rightarrow K^{+} \pi^{-}$and the penguin-dominated decay $\overline{B_{s}^{0}} \rightarrow K^{+} K^{-}$ have been reported by the CDF collaboration, and are in the right ball-park of the predictions shown in Table III. A good number of the decays shown in this Table will be measured at the LHC
and Super B-factories, which would discriminate among the predictions of the three frameworks.
The decays $B \rightarrow \pi \pi, B \rightarrow K \pi, B_{s} \rightarrow K \pi$ and $B_{s} \rightarrow K K$ have received a lot of theoretical interest, as they can be related by $\mathrm{SU}(3)$-symmetry, a question of considerable interest is the amount of $\operatorname{SU}(3)$-breaking in various topologies (diagrams) contributing to these decays. To that end, we present in Table IV the magnitude of the decay amplitudes (squared, in units of $\mathrm{GeV}^{2}$ ) involving the distinct topologies: $\mathcal{T}, \mathcal{P}, \mathcal{E}, \mathcal{P}_{\mathcal{A}}$ and $\mathcal{P}_{\mathcal{E W}}$ for the four decays modes of the $B_{d}^{0}$ and $B_{s}^{0}$ mesons. The two decays in the upper half of this table are related by U-spin symmetry $(d \rightarrow s)$ (likewise the two decays in the lower half). We note that the assumption of U-spin symmetry for the (dominant) tree $(\mathcal{T})$ and penguin $(\mathcal{P})$ amplitudes in the emission diagrams is quite good, it is less so in the other topologies, including the contributions from the $W$-exchange diagrams, denoted by $\mathcal{E}$ for which there are non-zero contributions for the flavor-diagonal states $\pi^{+} \pi^{-}$and $K^{+} K^{-}$only. The U-spin breaking is large in the electroweak penguin induced amplitudes $\mathcal{P}_{\mathcal{E W}}$, and in the penguin annihilation amplitudes $\mathcal{P}_{\mathcal{A}}$ relating the decays $B_{d} \rightarrow K^{+} \pi^{-}$and $B_{s} \rightarrow K^{+} K^{-}$. In the SM, however, the amplitudes $\mathcal{P}_{\mathcal{E W}}$ are negligibly small.

TABLE IV: Contributions from the various topologies to the decay amplitudes (squared) for the four indicated decays $B_{d}^{0} \rightarrow \pi^{+} \pi^{-} ; K^{+} \pi^{-}$and $B_{s}^{0} \rightarrow \pi^{+} K^{-} ; K^{+} K^{-}$. Here, $\mathcal{T}$ is the contribution from the color favored emission diagrams; $\mathcal{P}$ is the penguin contribution from the emission diagrams; $\mathcal{E}$ is the contribution from the W -exchange diagrams; $\mathcal{P}_{\mathcal{A}}$ is the contribution from the penguin annihilation amplitudes; and $\mathcal{P}_{\mathcal{E} W}$ is the contribution from the electro-weak penguin induced amplitude. See text for their definitions.

The direct $C P$ asymmetry of $\bar{B}_{s} \rightarrow f$ is defined as

$$
\begin{equation*}
A_{C P}^{d i r} \equiv \frac{B R\left(\bar{B}_{s}^{0} \rightarrow f\right)-B R\left(B_{s}^{0} \rightarrow \bar{f}\right)}{B R\left(\bar{B}_{s}^{0} \rightarrow f\right)+B R\left(B_{s}^{0} \rightarrow \bar{f}\right)}=\frac{\left|A\left(\bar{B}_{s} \rightarrow f\right)\right|^{2}-\left|A\left(B_{s} \rightarrow \bar{f}\right)\right|^{2}}{\left|A\left(\bar{B}_{s} \rightarrow f\right)\right|^{2}+\left|A\left(B_{s} \rightarrow \bar{f}\right)\right|^{2}} . \tag{65}
\end{equation*}
$$

The numerical results for the direct $C P$ asymmetries in $B \rightarrow P P$ decays are shown in Table $\mathbb{V}$, The first error is from the $B_{s}$ meson wave function parameter $\omega_{b}=0.50_{-0.05}^{+0.05} \mathrm{GeV}$. As $f_{B_{s}}$ is an
overall factor, it drops out in the ratio and hence does not give any uncertainty in the estimates of the direct CP asymmetries. The second error is from the hard scale $t$ varying from $0.75 t$ to $1.25 t$ (not changing $\left.1 / b_{i}, i=1,2,3\right)$ and $\Lambda_{Q C D}^{(5)}=0.25 \pm 0.05 \mathrm{GeV}$. The third error is again from the combined uncertainty in the $C K M$ matrix elements and the angles of the unitarity triangle. The observed CP asymmetry $A_{\mathrm{CP}}^{\mathrm{dir}}\left(\overline{B_{s}^{0}} \rightarrow K^{+} \pi^{-}\right)$by the CDF collaboration is also shown in this table, and is found to be in agreement with the pQCD predictions.

Within (large) theoretical errors, the observed CP asymmetry is also in agreement with the SCET estimate but in stark disagreement with the QCDF prediction. This deserves a comment. As is well-known, the decay rates and CP-asymmetries in the decays $\overline{B_{d}^{0}} \rightarrow \pi^{+} \pi^{-}$and $\overline{B_{s}^{0}} \rightarrow K^{+} \pi^{-}$ are related by $\mathrm{SU}(3)$ symmetry. The predicted CP asymmetry $A_{\mathrm{CP}}^{\mathrm{dir}}\left(\overline{B_{s}^{0}} \rightarrow K^{+} \pi^{-}\right)$in the QCDF approach shown in Table V is very similar to the $\mathrm{SU}(3)$-related CP asymmetry $A_{\mathrm{CP}}^{\text {dir }}\left(\overline{B_{d}^{0}} \rightarrow \pi^{+} \pi^{-}\right)$. These CP-asymmetries are small in the QCDF approach and both are consistently in disagreement with the data, in magnitude and sign. Using SU(3)-symmetry, the CP-asymmetry $A_{\mathrm{CP}}^{\mathrm{dir}}\left(\overline{B_{s}^{0}} \rightarrow\right.$ $K^{+} \pi^{-}$) in SCET, given in Table V, is identical to the values quoted in Ref. [20] for the CPasymmetry $\left.A_{\mathrm{CP}}^{\mathrm{dir}} \overline{B_{d}^{0}} \rightarrow \pi^{+} \pi^{-}\right)$. As the dynamical hadronic quantities in the SCET framework are fitted using the B-factory data on $B \rightarrow \pi \pi$ and $B \rightarrow K \pi$ [20], it is not surprising that this phenomenological fit can account for the $\mathrm{SU}(3)$-related observed CP-asymmetry in the $B_{s}^{0}$ decays, such as $A_{\mathrm{CP}}^{\mathrm{dir}}\left(\overline{B_{s}^{0}} \rightarrow K^{+} \pi^{-}\right)$. The fitted quantities, namely the SCET-specific functions $\zeta$, $\zeta_{J}$, differ from their corresponding QCDF analogs. But, crucially, also the contributions of the charming penguin [7], denoted as $\left|A_{\mathrm{cc}}\right|$ and $\arg A_{\mathrm{cc}}$ in [20], which are power-suppressed in QCDF, are found to be large using data and SCET. These differences lead to a different phenomenological profile of the $B \rightarrow h_{1} h_{2}$ decays in SCET and QCDF. However, one has to stress that the charming penguin contribution, which is not yet shown to factorize in SCET, obviously is not on the same theoretical footing as the rest of the decay amplitudes, for which factorization is proven in the heavy quark limit. Thus, the predictions in SCET [20] essentially reflect the parameterization of the charming penguins from the available data.

In general, one has also to take into account the uncertainties caused by the Gegenbauer moments. In recent years, the light cone distribution amplitudes have been continually updated [35]. In order to check the sensitivity to the values on the Gegenbauer moments, we calculate the branching ratio for $\bar{B}_{s} \rightarrow K^{+} \pi^{-}$with the following values for the twist- 2 LCDAs:

$$
\begin{equation*}
a_{1}^{K}=0.06 \pm 0.03, \quad a_{2}^{\pi, K}=0.25 \pm 0.15, \tag{66}
\end{equation*}
$$

instead of $a_{1}^{K}=0.17$ and $a_{2}^{K}=0.2$ from eq. (25) and $a_{2}^{\pi}=0.44$ from eq. (22). Using the above values and the asymptotic forms for the twist-3 LCDAs, we obtain

$$
\begin{equation*}
\mathcal{B R}\left(\bar{B}_{s}^{0} \rightarrow K^{+} \pi^{-}\right)=\left(7.2_{-2.2-0.8-0.5}^{+3.0+0.7+0.4}\right) \times 10^{-6}, \tag{67}
\end{equation*}
$$

where the errors are to be interpreted as before. The agreement between this result with the corresponding number listed in Table III confirms our expectation that this branching ratio is not changed significantly. In our calculation, the parameters in the LCDAs are chosen at $\mu=1 \mathrm{GeV}$ but as they are scale-dependent quantities, their value at $\mu=2 \mathrm{GeV}$, the typical scale which enters the perturbative calculation in pQCD , is required. At $\mu=2 \mathrm{GeV}$, the values for the Gegenbauer moments scaled from eq. (66) are:

$$
\begin{equation*}
a_{1}^{K}=0.05 \pm 0.02, \quad a_{2}^{\pi, K}=0.17 \pm 0.10 . \tag{68}
\end{equation*}
$$

Using these values, we obtain:

$$
\begin{equation*}
\mathcal{B R}\left(\bar{B}_{s}^{0} \rightarrow K^{+} \pi^{-}\right)=\left(6.9_{-2.1-0.7-0.5}^{+3.0+0.7+0.4}\right) \times 10^{-6} . \tag{69}
\end{equation*}
$$

We remark that the uncertainties caused by the scale dependence of the Gegenbauer moments are not large, compared with other uncertainties.

## D. The Observables $S_{f}$ and $H_{f}$ in time-dependent decays $B_{s}^{0}(t) \rightarrow f$

Restricting the final state $f$ to have definite CP-parity, the time-dependent decay width for the $B_{s} \rightarrow f$ decay is [54]:

$$
\begin{align*}
& \Gamma\left(B_{s}^{0}(t) \rightarrow f\right)=e^{-\Gamma t} \bar{\Gamma}\left(B_{s} \rightarrow f\right) {\left[\cosh \left(\frac{\Delta \Gamma t}{2}\right)+H_{f} \sinh \left(\frac{\Delta \Gamma t}{2}\right)\right.} \\
&\left.-\mathcal{A}_{\mathrm{CP}}^{d i r} \cos (\Delta m t)-S_{f} \sin (\Delta m t)\right] \tag{70}
\end{align*}
$$

where $\Delta m=m_{H}-m_{L}>0, \bar{\Gamma}$ is the average decay width, and $\Delta \Gamma=\Gamma_{H}-\Gamma_{L}$ is the difference of decay widths for the heavier and lighter $B_{s}^{0}$ mass eigenstates. The time dependent decay width $\Gamma\left(\bar{B}_{s}^{0}(t) \rightarrow f\right)$ is obtained from the above expression by flipping the signs of the $\cos (\Delta m t)$ and $\sin (\Delta m t)$ terms. In the $B_{s}$ system, we expect a much larger decay width difference $(\Delta \Gamma / \Gamma)_{B_{s}}$. This is estimated within the standard model to have a value $(\Delta \Gamma / \Gamma)_{B_{s}}=-0.12 \pm 0.05$ [55], updated recently in [56] to $(\Delta \Gamma / \Gamma)_{B_{s}}=-0.147 \pm 0.060$, while experimentally $(\Delta \Gamma / \Gamma)_{B_{s}}=-0.33_{-0.11}^{+0.09}[57]$,

TABLE V: The direct $C P$ asymmetries (in \%) in the $B_{s} \rightarrow P P$ decays, obtained in the pQCD approach (This work); the errors for these entries correspond to the uncertainties in the input hadronic quantities, from the scale-dependence, and the CKM matrix elements, respectively. The only measured CP asymmetry is also given [13]. For comparison, we also cite the theoretical estimates of the CP asymmetries in the QCD factorization framework 16], and in SCET [20].

so that both $S_{f}$ and $H_{f}$, can be extracted from the time dependent decays of $B_{s}$ mesons. The definition of the various quantities in the above equation are as follows:

$$
\begin{equation*}
S_{f}=\frac{2 \operatorname{Im}[\lambda]}{1+|\lambda|^{2}}, \quad H_{f}=\frac{2 \operatorname{Re}[\lambda]}{1+|\lambda|^{2}}, \tag{71}
\end{equation*}
$$

with

$$
\begin{equation*}
\lambda=\eta_{f} e^{2 i \epsilon} \frac{A\left(\bar{B}_{s} \rightarrow f\right)}{A\left(B_{s} \rightarrow \bar{f}\right)}, \tag{72}
\end{equation*}
$$

where $\eta_{f}$ is $+1(-1)$ for a CP-even (CP-odd) final state $f$ and $\epsilon=\arg \left[-V_{c b} V_{t s} V_{c s}^{*} V_{t b}^{*}\right]$. With the convention $\arg \left[V_{c b}\right]=\arg \left[V_{c s}\right]=0$, the parameter can be reduced to $\epsilon=\arg \left[-V_{t s} V_{t b}^{*}\right]$. The results of our calculations for the decays $B_{s}^{0} \rightarrow P P$ are listed in Table VI and compared with the ones obtained in SCET [20].

## E. Specific Tests of the pQCD predictions in $\overline{B_{d}^{0}} \rightarrow P P$ and $\overline{B_{s}^{0}} \rightarrow P P$ Decays

In this subsection, we confront the predictions of the pQCD approach to available data in the decay modes $\overline{B_{s}^{0}} \rightarrow P P$ and $\overline{B_{d}^{0}} \rightarrow P P$, in terms of the ratios of the branching ratios and CP-asymmetries. Restricted by the currently available data, we shall confine ourselves to the decay modes $\overline{B_{s}^{0}} \rightarrow K^{+} K^{-}, \overline{B_{s}^{0}} \rightarrow K^{+} \pi^{-}, \overline{B_{d}^{0}} \rightarrow \pi^{+} \pi^{-}$and $\overline{B_{d}^{0}} \rightarrow K^{-} \pi^{+}$. The ratio of the branching ratios defined as $R_{1} \equiv \frac{B R\left(\overline{B_{s}^{0}} \rightarrow K^{+} K^{-}\right.}{B R\left(\overline{B_{d}^{0}} \rightarrow \pi^{+} \pi^{-}\right)}$has been studied at some length in the literature. In $R_{1}$, the numerator is dominated by the penguin amplitude, but the denominator is a mixture of tree and penguin amplitudes, and both the numerator and denominator have been measured experimentally. It has been argued that the ratio $R_{1}$ and the two $C P$ asymmetries $S_{C P}\left(\bar{B}_{d}^{0} \rightarrow\right.$ $\left.\pi^{+} \pi^{-}\right)$and $C_{C P}\left(\bar{B}_{d}^{0} \rightarrow \pi^{+} \pi^{-}\right)=-A_{C D}^{d i r}\left(\bar{B}_{d}^{0} \rightarrow \pi^{+} \pi^{-}\right)$of the $\bar{B}_{d}^{0} \rightarrow \pi^{+} \pi^{-}$channel depend, in the $\mathrm{SU}(3)$ limit, on only two quantities [58] which can be determined from data and compared with the various dynamical models to get a clear picture of two-body non-leptonic decays. However, not invoking the $\mathrm{SU}(3)$ limit, this system of observables has too many unknowns and a clean test of the dynamical models is bogged down in the details of the hadronic input. To enable getting cleaner theoretical handles on the underlying dynamics, we calculate the ratio $R_{2} \equiv \frac{B R\left(\overline{B_{s}^{0} \rightarrow K^{+}} K^{-}\right)}{B R\left(B_{d}^{0} \rightarrow \pi^{+} K^{-}\right)}$, the ratio $R_{3}$ and the quantity called $\Delta$, defined later in this subsection. The last two (i.e. $R_{3}$ and $\Delta)$ have been advocated by Lipkin [60] invoking earlier work by Gronau [59] as precision tests of the SM.

The CDF collaboration has measured the branching ratio of $\overline{B_{s}^{0}} \rightarrow K^{+} K^{-}$in the form [13]:

$$
\begin{equation*}
\frac{f_{s} \cdot B R\left(\overline{B_{s}^{0}} \rightarrow K^{+} K^{-}\right)}{f_{d} \cdot B R\left(\overline{B_{d}^{0}} \rightarrow \pi^{+} K^{-}\right)}=0.324 \pm 0.019 \pm 0.041 . \tag{73}
\end{equation*}
$$

Using the results 57

$$
\begin{gather*}
f_{s}=(10.4 \pm 1.4) \%, \quad f_{d}=(39.8 \pm 1.0) \%,  \tag{74}\\
B R\left(\overline{B_{d}^{0}} \rightarrow \pi^{+} \pi^{-}\right)=(5.2 \pm 0.2) \times 10^{-6}, \tag{75}
\end{gather*}
$$

TABLE VI: The mixing-induced CP asymmetries $S_{f}$ (the first row of each decay channel) and the observables $H_{f}$ (the second row) in the $B_{s} \rightarrow P P$ decays calculated in the pQCD approach (This work). The errors for these entries correspond to the uncertainties in the input hadronic quantities, from the scale-dependence, and the CKM matrix elements, respectively. Estimates of these quantities in SCET [20] are also given, quoting two of these for the decays involving an $\eta$ and/or an $\eta^{\prime}$-meson.

one obtains $R_{1}$ and $R_{2}$ :

$$
\begin{equation*}
R_{1}=4.69 \pm 0.94, \quad R_{2}=1.24 \pm 0.24 \tag{76}
\end{equation*}
$$

We have calculated the branching ratios for the related $\overline{B_{d}^{0}} \rightarrow \pi^{+} \pi^{-}, \pi^{+} K^{-}$decays in the pQCD approach, getting:

$$
\begin{equation*}
B R\left(\overline{B_{d}^{0}} \rightarrow \pi^{+} \pi^{-}\right)=\left(5.8_{-2.1-0.4-0.3}^{+3.0+0.5+0.4}\right) \times 10^{-6}, \quad B R\left(\overline{B_{d}^{0}} \rightarrow \pi^{+} K^{-}\right)=\left(11.6_{-3.5-2.9-0.3}^{+5.0+5.2+0.7}\right) \times 10^{-6} . \tag{77}
\end{equation*}
$$

Taking into account the correlated errors in the numerator and the denominator, we get:

$$
\begin{equation*}
R_{1}=2.35_{-0.36-0.59-0.15}^{+0.45+0.99+0.19}, \quad R_{2}=1.18_{-0.11-0.08}^{+0.11+0.10+0.01} . \tag{78}
\end{equation*}
$$

Adding the theoretical errors in quadrature, we get $R_{1}=2.35_{-0.71}^{+1.10}$ and $R_{2}=1.18_{-0.14}^{+0.15}$. Hence, in the pQCD approach, the ratio $R_{1}$ is smaller compared to the current data. This originates from the fact that $B R\left(\overline{B_{d}^{0}} \rightarrow \pi^{+} \pi^{-}\right)$is somewhat larger in the pQCD approach compared to the data, and $B R\left(\overline{B_{s}^{0}} \rightarrow K^{+} K^{-}\right)$is smaller than the currently measured branching ratio (see Table III). Furthermore, the value of $R_{1}$ also depends on the $s$ quark mass through the chiral scale parameter $m_{0}^{K}=m_{K}^{2} /\left(m_{s}+m_{u, d}\right)$. If we use $m_{0}^{K}=(1.9 \pm 0.2) \mathrm{GeV}$, where the errors reflects the uncertainty in the quark masses, we find that $R_{1}$ has an additional uncertainty $R_{1}=2.35_{-0.49}^{+0.62}$. Adding this error with the one quoted above in quadrature yields $R_{1}=2.35_{-0.86}^{+1.26}$. It would be interesting to investigate how the NLO contributions modify the ratio $R_{1}$ as the tree and penguin amplitudes are expected to be renormalized differently including the $O\left(\alpha_{s}^{2}\right)$ corrections, as shown in [52] in the context of the $B_{d}^{0} \rightarrow P P$ decays.

The ratio $R_{2}$, on the other hand, comes out just about right in pQCD, as in this ratio both the numerator and denominator are dominated by QCD penguin amplitudes. One also expects that this ratio is stable under $O\left(\alpha_{s}^{2}\right)$ corrections, as the denominator in $R_{2}$ is itself stable against such corrections (see Table III in [52]) and very similar arguments apply to the decay rate for the numerator. The stability of the color-allowed QCD penguin amplitudes against one-loop corrections to the hard spectator scattering is also borne out in the QCD factorization framework [8]. The $\mathrm{SU}(3)$-breaking effects in $R_{2}$ are of the same size as the corresponding effects in the form factors, typically $\pm 30 \%$, and this likely is the dominant theoretical uncertainty in this ratio. In Fig. 廌, we plot the ratio $R_{2}$ vs. $A_{C P}^{\text {dir }}\left(K^{+} \pi^{-}\right)$for the LO pQCD-based calculations worked out by us and compare them with the current data on these observables. The experimental value of $R_{2}$ has already been given earlier, and we use $A_{C P}^{d i r}\left(B_{d}^{0} \rightarrow K^{+} \pi^{-}\right)=-0.093 \pm 0.015$ [57]. We

FIG. 5: $\quad R_{2}$ vs $A_{C P}^{d i r}(\pi K)$. The region inside the solid (red) box is the pQCD calculation in the LO. The experimental results are shown as bands within their $\pm 1 \sigma$ errors.
recall that the direct CP asymmetry $A_{C P}^{d i r}\left(K^{+} \pi^{-}\right)$, calculated by us in the LO pQCD approach, $A_{C P}^{d i r}\left(\overline{B_{d}^{0}} \rightarrow \pi^{+} K^{-}\right)=-0.17_{-0.02-0.02-0.01}^{+0.02+0.03+0.01}$ is numerically significantly different than the earlier estimates of the same in this approach (for example, the central value of this CP asymmetry in LO is quoted as -0.12 in [52]). This mismatch reflects the dependence of $A_{C P}^{d i r}\left(K^{+} \pi^{-}\right)$on the input quantities, in particular $V_{u b}$, which have evolved in the meanwhile. Thus, with our input values, we find good agreement with data on $R_{2}$ but not so for $A_{C P}^{d i r}\left(K^{+} \pi^{-}\right)$, as shown in Fig. 囵. However, taking into account the $\mathrm{O}\left(\alpha_{s}^{2}\right)$ contributions, this CP-asymmetry is renormalized while $R_{2}$ remains practically the same. Taking the central values from Table IV of Ref. [52], one gets a K-factor of 0.75 for $A_{C P}^{d i r}\left(K^{+} \pi^{-}\right)$(the central value in NLO is -0.09 with the input values used there). Using this K-factor, and our LO calculations, we estimate $A_{C P}^{d i r}\left(K^{+} \pi^{-}\right)=-0.13 \pm 0.04$ in NLO, making it compatible with the current data. This is shown in Fig. 6. It should, however, be pointed out for the sake of clarity that the NLO corrections in [52] are not complete, as the hard spectator contributions in $\mathrm{O}\left(\alpha_{s}^{2}\right)$ are not all calculated. Hence a residual contribution to $A_{C P}^{d i r}\left(K^{+} \pi^{-}\right)$(and other observables) can not be logically excluded. However, our discussion here underscores the dominant source of the uncertainty in $A_{C P}^{d i r}\left(K^{+} \pi^{-}\right)$, which is of parametric origin.

In $\overline{B_{d}^{0}} \rightarrow K^{-} \pi^{+}$and $\overline{B_{s}^{0}} \rightarrow K^{+} \pi^{-}$, the branching ratios are very different from each other due to the differing strong and weak phases entering in the tree and penguin amplitudes. However, as shown by Gronau [59], the two relevant products of the CKM matrix elements entering in the

FIG. 6: $\quad R_{2}$ vs $A_{C P}^{d i r}(\pi K)$. The region inside the solid (green) box is obtained by estimating $A_{C P}^{d i r}(\pi K)$ in NLO, as discussed in the text. $R_{2}(\mathrm{pQCD})$ and the experimental results are the same as in the previous figure.
expressions for the direct CP asymmetries in these decays are equal, and, as stressed by Lipkin [60] subsequently, the final states in these decays are charge conjugates, and the strong interactions being charge-conjugation invariant, the direct CP asymmetry in $\overline{B_{s}^{0}} \rightarrow K^{-} \pi^{+}$can be related to the well-measured CP asymmetry in the decay $\overline{B_{d}^{0}} \rightarrow K^{+} \pi^{-}$using U-spin symmetry. In this symmetry limit, we have [59, 60]

$$
\begin{align*}
& \left|A\left(B_{s} \rightarrow \pi^{+} K^{-}\right)\right|^{2}-\left|A\left(\bar{B}_{s} \rightarrow \pi^{-} K^{+}\right)\right|^{2}=\left|A\left(\bar{B}_{d} \rightarrow \pi^{+} K^{-}\right)\right|^{2}-\left|A\left(B_{d} \rightarrow \pi^{-} K^{+}\right)\right|^{2}  \tag{79}\\
& A_{C P}^{d i r}\left(\bar{B}_{d} \rightarrow \pi^{+} K^{-}\right)=-A_{C P}^{d i r}\left(\bar{B}_{s} \rightarrow \pi^{-} K^{+}\right) \cdot \frac{B R\left(B_{s} \rightarrow \pi^{+} K^{-}\right)}{B R\left(\bar{B}_{d} \rightarrow \pi^{+} K^{-}\right)} \cdot \frac{\tau\left(B_{d}\right)}{\tau\left(B_{s}\right)} \tag{80}
\end{align*}
$$

Following the suggestions in the literature, we can test these equations and search for possible new physics effects which would likely violate these relations. To that end, one can define the following two parameters (using Eq. (65) for the definition of CP asymmetry):

$$
\begin{align*}
R_{3} & \equiv \frac{\left|A\left(B_{s} \rightarrow \pi^{+} K^{-}\right)\right|^{2}-\left|A\left(\bar{B}_{s} \rightarrow \pi^{-} K^{+}\right)\right|^{2}}{\left|A\left(B_{d} \rightarrow \pi^{-} K^{+}\right)\right|^{2}-\left|A\left(\bar{B}_{d} \rightarrow \pi^{+} K^{-}\right)\right|^{2}},  \tag{81}\\
\Delta & =\frac{A_{C P}^{d i}\left(\bar{B}_{d} \rightarrow \pi^{+} K^{-}\right)}{A_{C P}^{d i r}\left(\bar{B}_{s} \rightarrow \pi^{-} K^{+}\right)}+\frac{B R\left(B_{s} \rightarrow \pi^{+} K^{-}\right)}{B R\left(\bar{B}_{d} \rightarrow \pi^{+} K^{-}\right)} \cdot \frac{\tau\left(B_{d}\right)}{\tau\left(B_{s}\right)} . \tag{82}
\end{align*}
$$

The standard model predicts $R_{3}=-1$ and $\Delta=0$ if we assume $U$-spin symmetry. Since we have a detailed dynamical theory to study the $\mathrm{SU}(3)$ (and U-spin) symmetry violation, we can check

FIG. 7: $\quad R_{3}$ vs $\Delta$ : The red (smaller) rectangle is the pQCD estimates worked out in this paper. The experimental results with their $\pm 1 \sigma$ errors are shown as the larger rectangle.
how good quantitatively this symmetry is in the ratios $R_{3}$ and $\Delta$. We find:

$$
\begin{equation*}
R_{3}=-1.00_{-0.04-0.04-0.08}^{+0.04+0.03+0.09}, \quad \Delta=-0.00_{-0.03}^{+0.03+0.02{ }_{-0.04}^{+0.06}} \tag{83}
\end{equation*}
$$

The differing values of $\omega_{B}$ and $\omega_{B_{s}}$, which enter in the $B_{d}^{0}$ and $B_{s}^{0}$-meson wave functions, contribute dominantly to the first errors, whereas the current uncertainties on the $C K M$ angle $\gamma$ and $V_{t s}$ are reflected in the third errors given above. The scale-dependent uncertainties leading to the second error are relatively small. Adding all the theoretical errors in quadrature, we get $R_{3}=-1.00_{-0.10}^{+0.10}$ and $\Delta=-0.00_{-0.05}^{+0.07}$. Thus, we find that these quantities are quite reliably calculable, as anticipated on theoretical grounds. On the experimental side, the results for $R_{3}$ and $\Delta$ are [13]:

$$
\begin{equation*}
R_{3}=-0.84 \pm 0.42 \pm 0.15, \quad \Delta=0.04 \pm 0.11 \pm 0.08 \tag{84}
\end{equation*}
$$

We conclude that the SM is in good agreement with the data, as can also be seen in Fig. 7 where we plot theoretical predictions for $R_{3}$ vs. $\Delta$ and compare them with the current measurements of the same. The measurements of these quantities are rather imprecise at present, a situation which we hope will greatly improve at the LHC (and Super-B factories).

## IV. CALCULATION OF $B_{s}$ TO A VECTOR AND A PSEUDO-SCALAR MESON IN THE PQCD APPROACH

## A. Decay amplitudes

In the decays of $B_{s}$ to a vector and a pseudo-scalar meson, only the longitudinal polarization of the vector meson can contribute, thus the decay formulas are very similar to those of the $B_{s} \rightarrow P P$ decays. Since the Lorentz structure of the vector meson wave functions is different from the pseudo-scalar case, there are two kinds of emission diagrams in principle. If the emitted meson is a vector meson, the decay amplitudes are the same as that of the $B_{s} \rightarrow P P$ case, since they are both characterized by the $B_{s} \rightarrow P$ transition form factors. For the non-factorizable diagrams and also those diagrams in which a pseudo-scalar meson is emitted, the distribution amplitudes of the pseudo-scalar meson will be replaced by that of the vector meson as follows:

$$
\begin{equation*}
\phi_{2}^{A}(x) \rightarrow \phi_{2}(x), \quad \phi_{2}^{P}(x) \rightarrow \phi_{2}^{s}(x), \quad \phi_{2}^{T}(x) \rightarrow \phi_{2}^{t}(x), \quad m_{02} \rightarrow M_{2}, \tag{85}
\end{equation*}
$$

where $M_{2}$ is the mass of the vector meson. The factorizable emission topology $F_{B \rightarrow P}^{S P}$ does not contribute as the vector meson cannot be generated by the scalar or the pseudo-scalar density. Furthermore, we must add a minus sign to $\phi_{3}^{s}(x)$ and $\phi_{3}^{t}(x)$ in the annihilation diagram formulas $F_{a n n}$ and $M_{a n n}$ if the vector meson is on the light $\bar{s}$ quark side.

## B. Numerical results for $B_{s} \rightarrow P V$ decays

The branching ratios of $B_{s} \rightarrow P V$ decays are listed in Table VII. The direct $C P$ asymmetries of the $B_{s} \rightarrow P V$ decays are given in Table VIII. They are compared with the corresponding calculations in the QCDF approach [16], where the sources of the errors in the numerical estimates have the same origin as in the discussion of the $B \rightarrow P P$ decays. Comparison of the entries in Table VIIshows that the two approaches give similar results for the tree-dominated decays and the QCD penguin- and electroweak-penguin dominated decays (except for those involving an $\eta$ or $\eta^{\prime}$ in the final states), and they are radically different for the annihilation-dominated decays (the last four entries in this table). The branching ratios for $\bar{B}_{s} \rightarrow \rho \eta$ and $\bar{B}_{s} \rightarrow \rho \eta^{\prime}$ are of the same order as the QCDF results, but there are large differences in $\bar{B}_{s} \rightarrow \omega(\phi) \eta$ and $\bar{B}_{s} \rightarrow \rho(\phi) \eta^{\prime}$. In QCDF, the branching ratios for $\bar{B}_{s} \rightarrow \phi \eta, \bar{B}_{s} \rightarrow \phi \eta^{\prime}$ and $\bar{B}_{s} \rightarrow \phi \pi^{0}$ (electro-weak penguin dominated process) are of the same magnitude, which implies that the color-suppressed QCD-penguins have a reduced
value similar to the electroweak penguins. However, in the pQCD approach, the factorization scale is low and this dynamically enhances the color-suppressed QCD penguins sizably.

Predictions for the CP-asymmetries in the two approaches given in Table VIII are, however, all quite different. The zeros shown in some cases for the pQCD approach will be lifted on including the neglected small subdominant contributions. Also, as opposed to the QCDF approach, we are able to calculate the CP asymmetries in the annihilation-dominated topologies. The mixinginduced $C P$ asymmetries $\left(S_{f}\right)_{B_{s}}$ and the observable $\left(H_{f}\right)_{B_{s}}$, defined in the previous section, are shown in Table IX. Currently, there is no data to confront the estimates given in Tables VII, VIII and IX, and again we hope that this will be remedied at the LHC (and Super-B factories).

## V. $B_{s} \rightarrow V V$ DECAYS IN PQCD APPROACH

## A. Decay amplitudes

There are three kinds of polarizations of a vector meson, namely longitudinal (L), normal $(\mathrm{N})$ and transverse $(\mathrm{T})$. The amplitudes for a $B_{s}$ meson decay to two vector mesons are also characterized by the polarization states of these vector mesons. The amplitudes $A^{(\sigma)}$ for the decay $B_{s}\left(P_{B}\right) \rightarrow V_{2}\left(P_{2}, \epsilon_{2 \mu}^{*}\right)+V_{3}\left(P_{3}, \epsilon_{3 \mu}^{*}\right)$ can be decomposed as follows:

$$
\begin{align*}
A^{(\sigma)} & =\epsilon_{2 \mu}^{*}(\sigma) \epsilon_{3 \nu}^{*}(\sigma)\left[a g^{\mu \nu}+\frac{b}{M_{2} M_{3}} P_{B}^{\mu} P_{B}^{\nu}+i \frac{c}{M_{2} M_{3}} \epsilon^{\mu \nu \alpha \beta} P_{2 \alpha} P_{3 \beta}\right] \\
& \equiv A_{L}+A_{N} \epsilon_{2}^{*}(\sigma=T) \cdot \epsilon_{3}^{*}(\sigma=T)+i \frac{A_{T}}{M_{B_{s}}^{2}} \epsilon^{\alpha \beta \gamma \rho} \epsilon_{2 \alpha}^{*}(\sigma) \epsilon_{3 \beta}^{*}(\sigma) P_{2 \gamma} P_{3 \rho} \tag{86}
\end{align*}
$$

where $M_{2}$ and $M_{3}$ are the masses of the vector mesons $V_{2}$ and $V_{3}$, respectively. The definitions of the amplitudes $A^{i}(i=L, N, T)$ in terms of the Lorentz-invariant amplitudes $a, b$ and $c$ are

$$
\begin{align*}
A_{L} & =a \epsilon_{2}^{*}(L) \cdot \epsilon_{3}^{*}(L)+\frac{b}{M_{2} M_{3}} \epsilon_{2}^{*}(L) \cdot P_{3} \epsilon_{3}^{*}(L) \cdot P_{2} \\
A_{N} & =a  \tag{87}\\
A_{T} & =\frac{c}{r_{2} r_{3}} .
\end{align*}
$$

The longitudinal polarization amplitudes for the $B_{s} \rightarrow V V$ decays can be obtained from those in the $B_{s} \rightarrow P P$ decays with the following replacement in the distribution amplitudes:

$$
\begin{equation*}
\phi_{2(3)}^{A}(x) \rightarrow \phi_{2(3)}(x), \quad \phi_{2(3)}^{P}(x) \rightarrow \phi_{2(3)}^{s}(x), \quad \phi_{2(3)}^{T}(x) \rightarrow \phi_{2(3)}^{t}(x), \tag{88}
\end{equation*}
$$

for the emission diagrams, while

$$
\begin{equation*}
\phi_{2(3)}^{A}(x) \rightarrow \phi_{2(3)}(x), \quad \phi_{2(3)}^{P}(x) \rightarrow(-) \phi_{2(3)}^{s}(x), \quad \phi_{2(3)}^{T}(x) \rightarrow(-) \phi_{2(3)}^{t}(x), \tag{89}
\end{equation*}
$$

TABLE VII: The $C P$-averaged branching ratios $\left(\times 10^{-6}\right)$ of $B_{s} \rightarrow P V$ decays obtained in the pQCD approach (This work); the errors for these entries correspond to the uncertainties in the input hadronic quantities, from the scale-dependence, and the CKM matrix elements, respectively. For comparison, we also cite the theoretical estimates of the branching ratios in the QCD factorization framework [16].

TABLE VIII: The direct $C P$ asymmetries (in \%) in the $B_{s} \rightarrow P V$ decays, obtained in the pQCD approach (This work); the errors for these entries correspond to the uncertainties in the input hadronic quantities, from the scale-dependence, and the CKM matrix elements, respectively. For comparison, we also cite the theoretical estimates of the CP asymmetries in the QCD factorization framework [16].

for the annihilation diagrams. The factorizable emission topology contribution $F_{B_{s} \rightarrow V_{3}}^{S P, i}(i=$ $L, N, T)$ vanish due to the conservation of charge parity.

The normal and transverse polarization amplitudes for $B_{s} \rightarrow V V$ decays are displayed as
follows. For the factorizable emission diagrams shown in Fig.3(a) and (b), the formulas are

$$
\begin{align*}
f_{V_{2}} F_{B_{s} \rightarrow V_{3}}^{L L, N}\left(a_{i}\right)= & 8 \pi C_{F} M_{B_{s}}^{4} f_{V_{2}} r_{2} \int_{0}^{1} d x_{1} d x_{3} \int_{0}^{\infty} b_{1} d b_{1} b_{3} d b_{3} \phi_{B_{s}}\left(x_{1}, b_{1}\right)\left\{h_{e}\left(x_{1}, x_{3}, b_{1}, b_{3}\right)\right. \\
& \times E_{e}\left(t_{a}\right) a_{i}\left(t_{a}\right)\left[\phi_{3}^{T}\left(x_{3}\right)+2 r_{3} \phi_{3}^{v}\left(x_{3}\right)+r_{3} x_{3}\left(\phi_{3}^{v}\left(x_{3}\right)-\phi_{3}^{a}\left(x_{3}\right)\right)\right] \\
& \left.+r_{3}\left[\phi_{3}^{v}\left(x_{3}\right)+\phi_{3}^{a}\left(x_{3}\right)\right] E_{e}\left(t_{a}^{\prime}\right) a_{i}\left(t_{a}^{\prime}\right) h_{e}\left(x_{3}, x_{1}, b_{3}, b_{1}\right)\right\},  \tag{90}\\
f_{V_{2}} F_{B_{s} \rightarrow V_{3}}^{L L, T}\left(a_{i}\right)= & 16 \pi C_{F} M_{B_{s}}^{4} f_{V_{2}} r_{2} \int_{0}^{1} d x_{1} d x_{3} \int_{0}^{\infty} b_{1} d b_{1} b_{3} d b_{3} \phi_{B_{s}}\left(x_{1}, b_{1}\right)\left\{h_{e}\left(x_{1}, x_{3}, b_{1}, b_{3}\right)\right. \\

\end{align*}
$$

The factorizable annihilation diagrams are shown in Fig.4 (a) and (b), and the normal polarization contributions are:

$$
\begin{align*}
f_{B_{s}} F_{a n n}^{L L, N}\left(a_{i}\right)= & f_{B_{s}} F_{a n n}^{L R, N}\left(a_{i}\right) \\
= & -8 \pi C_{F} M_{B_{s}}^{4} f_{B_{s}} r_{2} r_{3} \int_{0}^{1} d x_{2} d x_{3} \int_{0}^{\infty} b_{2} d b_{2} b_{3} d b_{3}\left\{E_{a}\left(t_{c}\right) a_{i}\left(t_{c}\right) h_{a}\left(x_{2}, 1-x_{3}, b_{2}, b_{3}\right)\right) \\
& {\left[\left(2-x_{3}\right)\left(\phi_{2}^{v}\left(x_{2}\right) \phi_{3}^{v}\left(x_{3}\right)+\phi_{2}^{a}\left(x_{2}\right) \phi_{3}^{a}\left(x_{3}\right)\right)+x_{3}\left(\phi_{2}^{v}\left(x_{2}\right) \phi_{3}^{a}\left(x_{3}\right)+\phi_{2}^{a}\left(x_{2}\right) \phi_{3}^{v}\left(x_{3}\right)\right)\right] } \\
& -h_{a}\left(1-x_{3}, x_{2}, b_{3}, b_{2}\right)\left[\left(1+x_{2}\right)\left(\phi_{2}^{v}\left(x_{2}\right) \phi_{3}^{v}\left(x_{3}\right)+\phi_{2}^{a}\left(x_{2}\right) \phi_{3}^{a}\left(x_{3}\right)\right)\right. \\
& \left.\left.-\left(1-x_{2}\right)\left(\phi_{2}^{v}\left(x_{2}\right) \phi_{3}^{a}\left(x_{3}\right)+\phi_{2}^{a}\left(x_{2}\right) \phi_{3}^{v}\left(x_{3}\right)\right)\right] E_{a}\left(t_{c}^{\prime}\right) a_{i}\left(t_{c}^{\prime}\right)\right\} . \tag{99}
\end{align*}
$$

Note, that large cancellations between the two diagrams Fig.4 (a) and (b) take place, as a result of which contributions from these diagrams are suppressed.

For the transverse polarization, we have

$$
\begin{align*}
f_{B_{s}} F_{a n n}^{L L, T}\left(a_{i}\right)= & -f_{B_{s}} F_{a n n}^{L R, T}\left(a_{i}\right) \\
= & -16 \pi C_{F} M_{B_{s}}^{4} f_{B_{s}} r_{2} r_{3} \int_{0}^{1} d x_{2} d x_{3} \int_{0}^{\infty} b_{2} d b_{2} b_{3} d b_{3}\left\{\left[x_{3}\left(\phi_{2}^{v}\left(x_{2}\right) \phi_{3}^{v}\left(x_{3}\right)+\phi_{2}^{a}\left(x_{2}\right) \phi_{3}^{a}\left(x_{3}\right)\right)\right.\right. \\
& \left.+\left(2-x_{3}\right)\left(\phi_{2}^{v}\left(x_{2}\right) \phi_{3}^{a}\left(x_{3}\right)+\phi_{2}^{a}\left(x_{2}\right) \phi_{3}^{v}\left(x_{3}\right)\right)\right] E_{a}\left(t_{c}\right) a_{i}\left(t_{c}\right) h_{a}\left(x_{2}, 1-x_{3}, b_{2}, b_{3}\right) \\
& +h_{a}\left(1-x_{3}, x_{2}, b_{3}, b_{2}\right)\left[\left(1-x_{2}\right)\left(\phi_{2}^{v}\left(x_{2}\right) \phi_{3}^{v}\left(x_{3}\right)+\phi_{2}^{a}\left(x_{2}\right) \phi_{3}^{a}\left(x_{3}\right)\right)\right. \\
& \left.\left.-\left(1+x_{2}\right)\left(\phi_{2}^{v}\left(x_{2}\right) \phi_{3}^{a}\left(x_{3}\right)+\phi_{2}^{a}\left(x_{2}\right) \phi_{3}^{v}\left(x_{3}\right)\right)\right] E_{a}\left(t_{c}^{\prime}\right) a_{i}\left(t_{c}^{\prime}\right)\right\} . \tag{100}
\end{align*}
$$

We remark that, although the cancellations in this case are not as severe as for the normal polarization case, the dominant contributions are still power suppressed by $r_{2} r_{3}$, where $r_{2(3)}=$
$M_{2(3)} / M_{B_{s}}$. For the $(S-P)(S+P)$ operators, we have

$$
\begin{align*}
f_{B_{s}} F_{a n n}^{S P, T}\left(a_{i}\right)= & 2 f_{B_{s}} F_{a n n}^{S P, N}\left(a_{i}\right) \\
= & -32 \pi C_{F} M_{B_{s}}^{4} f_{B_{s}} \int_{0}^{1} d x_{2} d x_{3} \int_{0}^{\infty} b_{2} d b_{2} b_{3} d b_{3}\left\{r_{2}\left(\phi_{2}^{v}\left(x_{2}\right)+\phi_{2}^{a}\left(x_{2}\right)\right) \phi_{3}^{T}\left(x_{3}\right)\right. \\
& \times E_{a}\left(t_{c}\right) a_{i}\left(t_{c}\right) h_{a}\left(x_{2}, 1-x_{3}, b_{2}, b_{3}\right) \\
& \left.+r_{3} \phi_{2}^{T}\left(x_{2}\right)\left(\phi_{3}^{v}\left(x_{3}\right)-\phi_{3}^{a}\left(x_{3}\right)\right) E_{a}\left(t_{c}^{\prime}\right) a_{i}\left(t_{c}^{\prime}\right) h_{a}\left(1-x_{3}, x_{2}, b_{3}, b_{2}\right)\right\} . \tag{101}
\end{align*}
$$

Again, for this case, like the $B_{s} \rightarrow P P$ decays, no cancellations among the contributing diagrams or power suppressions are involved. The chiral enhancement here for the transverse and normal polarizations are essential for the explanation of the large transverse polarization fraction in the penguin dominant $B$ decays, such as $B \rightarrow K^{*} \phi$ and $B \rightarrow K^{*} \rho$ decays [42, 43]. For the nonfactorizable annihilation diagrams shown in Fig[4 (c) and (d), we have

$$
\begin{align*}
M_{a n n}^{L L, N}\left(a_{i}\right)= & M_{a n n}^{S P, N}\left(a_{i}\right) \\
= & -64 \pi C_{F} M_{B_{s}}^{4} r_{2} r_{3} / \sqrt{6} \int_{0}^{1} d x_{1} d x_{2} d x_{3} \int_{0}^{\infty} b_{1} d b_{2} b_{2} d b_{2} \phi_{B_{s}}\left(x_{1}, b_{1}\right)\left[\phi_{2}^{v}\left(x_{2}\right) \phi_{3}^{v}\left(x_{3}\right)\right. \\
& \left.+\phi_{2}^{a}\left(x_{2}\right) \phi_{3}^{a}\left(x_{3}\right)\right] E_{a}^{\prime}\left(t_{d}\right) a_{i}\left(t_{d}\right) h_{n a}\left(x_{1}, x_{2}, x_{3}, b_{1}, b_{2}\right),  \tag{102}\\
M_{a n n}^{L L, T}\left(a_{i}\right)=- & M_{a n n}^{S P, T}\left(a_{i}\right) \\
=- & -128 \pi C_{F} M_{B_{s}}^{4} r_{2} r_{3} / \sqrt{6} \int_{0}^{1} d x_{1} d x_{2} d x_{3} \int_{0}^{\infty} b_{1} d b_{2} b_{2} d b_{2} \phi_{B_{s}}\left(x_{1}, b_{1}\right)\left[\phi_{2}^{v}\left(x_{2}\right) \phi_{3}^{a}\left(x_{3}\right)\right. \\
& \left.+\phi_{2}^{a}\left(x_{2}\right) \phi_{3}^{v}\left(x_{3}\right)\right] E_{a}^{\prime}\left(t_{d}\right) a_{i}\left(t_{d}\right) h_{n a}\left(x_{1}, x_{2}, x_{3}, b_{1}, b_{2}\right), \tag{103}
\end{align*}
$$

$$
\begin{align*}
M_{\text {ann }}^{L R, T}\left(a_{i}\right)= & 2 M_{\text {ann }}^{L R, N}\left(a_{i}\right) \\
= & -64 \pi C_{F} M_{B_{s}}^{4} / \sqrt{6} \int_{0}^{1} d x_{1} d x_{2} d x_{3} \int^{\infty} b_{1} d b_{1} b_{2} d b_{2} \phi_{B_{s}}\left(x_{1}, b_{1}\right)\left\{h_{n a}^{\prime}\left(x_{1}, x_{2}, x_{3}, b_{1}, b_{2}\right)\right. \\
& {\left[r_{2} x_{2}\left(\phi_{2}^{v}\left(x_{2}\right)+\phi_{2}^{a}\left(x_{2}\right)\right) \phi_{3}^{T}\left(x_{3}\right)-r_{3}\left(1-x_{3}\right) \phi_{2}^{T}\left(x_{2}\right)\left(\phi_{3}^{v}\left(x_{3}\right)-\phi_{3}^{a}\left(x_{3}\right)\right)\right] E_{a}^{\prime}\left(t_{d}^{\prime}\right) a_{i}\left(t_{d}^{\prime}\right) } \\
& +\left[r_{2}\left(2-x_{2}\right)\left(\phi_{2}^{v}\left(x_{2}\right)+\phi_{2}^{a}\left(x_{2}\right)\right) \phi_{3}^{T}\left(x_{3}\right)-r_{3}\left(1+x_{3}\right) \phi_{2}^{T}\left(x_{2}\right)\left(\phi_{3}^{v}\left(x_{3}\right)-\phi_{3}^{a}\left(x_{3}\right)\right)\right] \\
& \left.\times E_{a}^{\prime}\left(t_{d}\right) a_{i}\left(t_{d}\right) h_{n a}\left(x_{1}, x_{2}, x_{3}, b_{1}, b_{2}\right)\right\} . \tag{104}
\end{align*}
$$

These contributions are all power-suppressed as expected.

## B. Numerical results for $B_{s} \rightarrow V V$ decays

The decay width for $B_{s} \rightarrow V_{2} V_{3}$ is given as

$$
\begin{equation*}
\Gamma=\frac{P_{c}}{8 \pi M_{B_{s}}^{2}} \sum_{i=0, \|, \perp} A_{(i)}^{\dagger} A_{(i)}, \tag{105}
\end{equation*}
$$

where $P_{c}$ is the momentum of either of the two vector mesons in the final states. The sum is over the three transversity amplitudes of the two vector mesons, defined as follows:

$$
\begin{align*}
A_{0} & \equiv-A_{L} \\
A_{\|} & \equiv \sqrt{2} a \\
A_{\perp} & \equiv r_{2} r_{3} \sqrt{2\left(\kappa^{2}-1\right)} A_{T} \tag{106}
\end{align*}
$$

with the ratio $\kappa=P_{2} \cdot P_{3} /\left(M_{2} M_{3}\right)$. Note that the definitions of $A_{i}(i=0, \|, \perp)$ are consistent with those in [18], except for an additional minus sign in $A_{0}$, so that our definitions of the relative strong phases $\phi_{i}(i=\|, \perp)$ (see text below) also differ from the ones in [18] by $\pi$. The polarization fractions $f_{i}(i=0, \|, \perp)$ are defined as follows:

$$
\begin{equation*}
f_{i}=\frac{\left|A_{i}\right|^{2}}{\left|A_{0}\right|^{2}+\left|A_{\|}\right|^{2}+\left|A_{\perp}\right|^{2}} . \tag{107}
\end{equation*}
$$

We first give the numerical results of the form factors at maximal recoil:

$$
\begin{align*}
& V^{B \rightarrow K^{*}}=0.25_{-0.05-0.00}^{+0.05+0.00}, \quad A_{0}^{B \rightarrow K^{*}}=0.30_{-0.05-0.01}^{+0.06+0.00}, \quad A_{1}^{B \rightarrow K^{*}}=0.19_{-0.03-0.00}^{+0.04+0.00}, \\
& V^{B \rightarrow \rho}=0.21_{-0.04-0.00}^{+0.05+0.00}, \quad A_{0}^{B \rightarrow \rho}=0.25_{-0.04-0.01}^{+0.05+0.00}, \quad A_{1}^{B \rightarrow \rho}=0.17_{-0.03}^{+0.04+0.00}, \\
& V^{B \rightarrow \omega}=0.19_{-0.04-0.00}^{+0.04+0.00}, \quad A_{0}^{B \rightarrow \omega}=0.23_{-0.04-0.01}^{+0.05+0.00}, \quad A_{1}^{B \rightarrow \omega}=0.15_{-0.03-0.00}^{+0.03+0.00} \text {. }  \tag{108}\\
& V^{B_{s} \rightarrow K^{*}}=0.21_{-0.03-0.01}^{+0.04+0.00}, A_{0}^{B_{s} \rightarrow K^{*}}=0.25_{-0.05-0.01}^{+0.05+0.00}, A_{1}^{B_{s} \rightarrow K^{*}}=0.16_{-0.03-0.01}^{+0.03+0.00} \text {, } \\
& V^{B_{s} \rightarrow \phi}=0.25_{-0.04-0.01}^{+0.05+0.00}, \quad A_{0}^{B_{s} \rightarrow \phi}=0.30_{-0.05-0.01}^{+0.05+0.00}, \quad A_{1}^{B_{s} \rightarrow \phi}=0.19_{-0.03-0.01}^{+0.03+0.00} \text {. }
\end{align*}
$$

where the first error in the above entries is due to the input hadronic parameters $f_{B\left(B_{s}\right)}, \omega_{b}$ and the second one is from the hard scale and $\Lambda_{Q C D}$. The entries in the first three lines involve the decays of the $B^{ \pm}$and $B_{d}^{0}$ mesons to two vector mesons, and as such are not required for the $B_{s}^{0} \rightarrow V V$ decays being worked out in this paper. We list them here to see the $\mathrm{SU}(3)$-breaking effects in the form factors. Within errors, these form factors are in agreement with the ones in the light cone QCD sum rules [61] and with the slightly different estimates of the same in [18]. The branching ratios of $B_{s} \rightarrow V V$ decays are listed in Table X. They are compared with the corresponding results in the QCDF approach [18]. A comparison shows that the tree-, penguinand electroweak dominated decays are comparable in the two approaches, with the numerical differences reflecting the input parameters. The color-suppressed decays, but more markedly the annihilation-dominated decays, differ in these approaches, a feature which is well appreciated in the literature. The experimental upper bounds on some of the decays are also listed. Except for the decay $\overline{B_{s}} \rightarrow \phi \phi$, where an experimental measurement may be just around the corner, all other decay modes remain essentially unexplored.

TABLE X: The CP-averaged branching ratios in $B_{s} \rightarrow V V$ decays $\left(\times 10^{-6}\right)$ obtained in the pQCD approach (This work); the errors for these entries correspond to the uncertainties in the input hadronic quantities, from the scale-dependence, and the CKM matrix elements, respectively. For comparison, we also cite the updated theoretical estimates in the QCD factorization framework [18]. The experimental upper limits (at 90\% C.L.) are from the Particle Data Group [28].

The results for the longitudinal polarization fraction $f_{0}$, parallel polarization fraction $f_{\|}$and perpendicular polarization fraction $f_{\perp}$, their relative phases $\phi_{\|} \equiv \operatorname{Arg}\left(A_{\|} / A_{0}\right)$ and $\phi_{\perp} \equiv \operatorname{Arg}\left(A_{\perp} / A_{0}\right)$ (both in radians), and the direct CP-asymmetry in the $\overline{B_{s}^{0}} \rightarrow V V$ decays are displayed in Table XI. In calculating the CP-asymmetries, we have used the definition given earlier in Eq. 65, Again, there are no data available to confront the entries in Table XI.

Two remarks on the $B_{s} \rightarrow \phi \phi$ decays presented above are in order.
First, $B_{s} \rightarrow \phi \phi$ is a $b \rightarrow s$ penguin dominated process. The CDF collaboration 62] has reported the decay branching fraction of this channel as $(14 \pm 8) \times 10^{-6}$, but a thorough angular analysis is still lacking. This channel is very similar to the decay $B \rightarrow \phi K^{*}$, which is well measured in the experiment. In the $B \rightarrow \phi K^{*}$ decays, the data show that the fraction of the
left-handed polarization reaches about $50 \%$. This result is quite different from the expectation in the factorization assumption that the longitudinal polarization should dominate due to the quark helicity analysis. There exist lots of theoretical attempts to solve this contradiction. To distinguish, which one is the most appropriate scheme, we must investigate the decay $B_{s} \rightarrow \phi \phi$ and other similar channels.

In the pQCD approach, the weak annihilation diagram induced by the operator $O_{6}$ can enhance the transverse polarization sizably. In Ref. [63], the longitudinal fraction of $B \rightarrow \phi K^{*}$ is about 75 \%, which is much smaller than that obtained based on the factorization assumption, but still larger than the data. Moreover, the branching fraction is overestimated. Li [64] has suggested a strategy to solve these two problems together, by invoking a smaller value for the form factor $A_{0}$. A smaller $A_{0}$ is also consistent with the predictions in other approaches, such as the covariant light front quark model [65]. In the pQCD approach, a smaller $A_{0}$ requires smaller Gegenbauer moments of the longitudinal polarized distribution amplitudes of the recoiling vector meson. Following this lead, and performing a calculation using the asymptotic distribution amplitude for $K^{*}$, one indeed finds that the longitudinal polarization fraction can be reduced; Ref. [64] finds that this fraction can be reduced to $59 \%$.

Based on the above discussion, we also analyzed the $B_{s} \rightarrow V V$ decays adopting the asymptotic forms of the twist-3 distribution amplitudes in the pQCD approach, while keeping the leadingtwist distribution amplitudes up to the second Gegenbauer moments, as done for the pseudo-scalar meson case discussed earlier. In addition, we also test the sensitivity of the branching ratio of the $B_{s} \rightarrow \phi \phi$ decay on the Gengenbauer moments of the twist-2 distribution amplitudes. The result of the branching ratio for this channel with asymptotic twist-2 distribution amplitudes is $22.2 \times 10^{-6}$, which is much smaller than that for the case with higher Gegenbauer moments and is closer to the experiment. However, we find that the polarization fractions do not change too much using the asymptotic forms of distribution amplitudes. The reason is that the contributions from the annihilation topology, which enhance the transverse polarization fraction, also decrease with a decreased value of the form factor $A_{0}$. This is different from the $B \rightarrow \phi K^{*}$ decay.

Second, it is to be noted that the longitudinal polarization of $B \rightarrow \phi K^{*}$ and $\bar{B}_{s} \rightarrow \phi \phi$ can be related to each other in the $\mathrm{SU}(3)$ limit. The discrepancy between them represents $\mathrm{SU}(3)$ symmetry breaking effects, which can be reflected in the following aspects in the pQCD approach specifically: In the first place, the shape parameter of $B$ and $B_{s}$ wavefunction in the initial state can give rise to differences in these two U-spin related process. Then, the longitudinal and

TABLE XI: The CP-averaged polarization fractions, relative phases and direct CP asymmetries in the $B_{s} \rightarrow V V$ decays obtained in the pQCD approach; the errors for these entries correspond to the uncertainties in the input hadronic quantities, from the scale-dependence, and the CKM matrix elements, respectively.

transverse decay constants as well as the Gegenbauer moments in the two vector mesons in the final state can also contribute to the $\mathrm{SU}(3)$ symmetry breaking effects significantly. In addition, these two decay processes also differ due to the absence of the time-like penguin annihilation in the $B \rightarrow \phi K^{*}$ decay.

## VI. SUMMARY

With the LHC era almost upon us, where apart from the decisive searches for the Higgs boson(s) and supersymmetry (or, alternatives thereof), also dedicated studies of the $B_{s}^{0}$-meson physics (as well as that of the heavier $b$-hadrons) will be carried out. First results on the decay characteristics
of the $B_{s}^{0}$-mesons are already available from the Tevatron, in particular the $B_{s}^{0}-\overline{B_{s}^{0}}$-mixing induced mass difference $\Delta M_{s}$, the branching ratios for the decays $\overline{B_{s}^{0}} \rightarrow K^{+} \pi^{-}, \overline{B_{s}^{0}} \rightarrow K^{+} K^{-}, \overline{B_{s}^{0}} \rightarrow \phi \phi$, and the first direct CP asymmetry $\left.A_{\mathrm{CP}}^{\text {dir }} \overline{B_{s}^{0}} \rightarrow K^{+} \pi^{-}\right)$. These measurements owe themselves to the two experiments CDF and D0; they are impressive and prove that cutting-edge B physics can also be carried out by general purpose hadron collider experiments. At the LHC, we will have a dedicated $b$-physics experiment, LHCb, but also the two main general purpose detectors ATLAS and CMS will be able to contribute handsomely to the ongoing research in $b$-physics. Conceivably, also at a Super-B factory with dedicated running at the $\Upsilon(5 S)$-resonance, the current experimental databank on the $B_{s}$-meson will be greatly enlarged.

Anticipating these developments, we have presented in this work the results of a comprehensive study of the decays $\overline{B_{s}^{0}} \rightarrow h_{1} h_{2}$, where $h_{1}$ and $h_{2}$ are light (i.e., charmless) pseudo-scalar and vector mesons. This study has been carried out in the context of the pQCD approach, taking into account the most recent information on the CKM matrix elements and weak phases and updating the input hadronic parameters. The decay amplitudes contain the relevant emission and annihilation diagrams of the tree and penguin nature. Explicit formulae for all these amplitudes, including the various pQCD-related functions, are provided in the Appendices. Numerical results for the charge-conjugation averaged branching ratios, the direct CP asymmetries and the mixinginduced CP-asymmetries $S_{f}$ for the CP-eigenstates $f$, and the time-dependent observable $H_{f}$ are presented in the form of tables. In addition, for the $\overline{B_{s}^{0}} \rightarrow V V$ decays, we also calculate the charge-conjugation-averaged transversity amplitudes, their relative strong phases and magnitudes. The results for the altogether $49 \overline{B_{s}^{0}} \rightarrow h_{1} h_{2}$ decays include also theoretical errors coming from the input hadronic parameters, variation of the hard scattering scale together with the uncertainty on $\Lambda_{\mathrm{QCD}}$, and the combined uncertainty in the CKM matrix elements and the angles of the unitarity triangle. For the last mentioned error, we use the recently updated results from the CKMfitter [53].

Our results are compared with the available data on the decays $\overline{B_{s}^{0}} \rightarrow h_{1} h_{2}$ from the Tevatron, and some selected $\overline{B_{d}^{0}} \rightarrow h_{1} h_{2}$ decays from the B-factory experiments, updating the theoretical calculations in the pQCD approach with our input parameters. In particular, we revisited the well-measured direct CP asymmetry $A_{K \pi}^{d i r}\left(B_{d}^{0} \rightarrow K^{+} \pi^{-}\right)$, working out the parametric sensitivity of this observable, and argued that data can be accommodated in the pQCD approach by invoking $O\left(\alpha_{s}^{2}\right)$ contributions, which we estimated from the existing literature. The successful predictions of this direct CP-asymmetry in the pQCD approach is set forth with the first observed CPasymmetry in the decay $\overline{B_{s}^{0}} \rightarrow K^{+} \pi^{-}$. This CP-asymmetry is experimentally large and is in good
agreement with our numerical results, within the stated errors. We have also analyzed a number of ratios of branching ratio involving the $B_{s}^{0} \rightarrow P P$ and $B_{d}^{0} \rightarrow P P$ decays. They include the ratios $R_{1} \equiv \frac{B R\left(\overline{B_{s}^{0}} \rightarrow K^{+} K^{-}\right)}{B R\left(\overline{B_{d}^{0}} \rightarrow \pi^{+} \pi^{-}\right)}, R_{2} \equiv \frac{B R\left(\overline{B_{8}^{0}} \rightarrow K^{+} K^{-}\right)}{B R\left(\overline{B_{d}^{0}} \rightarrow K^{-} \pi^{+}\right)}$, and two more, called $R_{3}$ and $\Delta$, defined in Eq. (72) and (73), respectively, which involve the decays $\overline{B_{d}^{0}} \rightarrow K^{-} \pi^{+}$and $\overline{B_{s}^{0}} \rightarrow K^{+} \pi^{-}$and their charge conjugates. Except for the ratio $R_{1}$, for which the pQCD calculations presented here are on the lower side of the data (within large errors), the others are well accounted for. We also compare our results with the corresponding ones in the QCDF and SCET approaches. What concerns the branching ratios, we find reasonable agreement for some topological amplitudes, but also major disagreement, in particular for those decays which are dominated by the color-suppressed tree and annihilation amplitudes. There are striking differences in the CP asymmetries, in particular with the QCDF-based estimates, which will be precisely tested in the future.

Experimental precision on $B_{s}$ decays will improve enormously in the coming years, thanks to dedicated experiments at the Tevatron and LHC. Many of the decay rates and CP asymmetries worked out here will be put to experimental scrutiny. They can be combined with the B-factory data on the corresponding $B \rightarrow P P, P V, V V$ decays, eliminating some of the large parametric uncertainties in theoretically well-motivated ratios to test the SM precisely in exclusive hadronic decays. In principle, theoretical predictions presented here can be systematically improved by including higher order perturbative corrections (in $\alpha_{s}$ ) and sub-leading power corrections in $1 / m_{b}$.

## Acknowledgment

This work is partly supported by National Science Foundation of China under the Grant Numbers 10475085 and 10625525. One of us (C.-D.L.) would like to acknowledge the financial support of the Sino-German Center for Science Promotion (Grant No. GZ 369), the Alexander-von-Humboldt-Foundation and DESY. We would like to thank Vladimir Braun for a discussion on the $\mathrm{SU}(3)$-breaking effects in the light-cone-distribution amplitudes of light mesons.

## APPENDIX A: PQCD FUNCTIONS

In this section, we group the functions which appear in the factorization formulae.
The hard scales are chosen as

$$
\begin{align*}
t_{a} & =\max \left\{\sqrt{x_{3}} M_{B_{s}}, 1 / b_{1}, 1 / b_{3}\right\},  \tag{A1}\\
t_{a}^{\prime} & =\max \left\{\sqrt{x_{1}} M_{B_{s}}, 1 / b_{1}, 1 / b_{3}\right\},  \tag{A2}\\
t_{b} & =\max \left\{\sqrt{x_{1} x_{3}} M_{B_{s}}, \sqrt{\left|1-x_{1}-x_{2}\right| x_{3}} M_{B_{s}}, 1 / b_{1}, 1 / b_{2}\right\},  \tag{A3}\\
t_{b}^{\prime} & =\max \left\{\sqrt{x_{1} x_{3}} M_{B_{s}}, \sqrt{\left|x_{1}-x_{2}\right| x_{3}} M_{B_{s}}, 1 / b_{1}, 1 / b_{2}\right\},  \tag{A4}\\
t_{c} & =\max \left\{\sqrt{1-x_{3}} M_{B_{s}}, 1 / b_{2}, 1 / b_{3}\right\},  \tag{A5}\\
t_{c}^{\prime} & =\max \left\{\sqrt{x_{2}} M_{B_{s}}, 1 / b_{2}, 1 / b_{3}\right\},  \tag{A6}\\
t_{d} & =\max \left\{\sqrt{x_{2}\left(1-x_{3}\right)} M_{B_{s}}, \sqrt{1-\left(1-x_{1}-x_{2}\right) x_{3}} M_{B_{s}}, 1 / b_{1}, 1 / b_{2}\right\},  \tag{A7}\\
t_{d}^{\prime} & =\max \left\{\sqrt{x_{2}\left(1-x_{3}\right)} M_{B_{s}}, \sqrt{\left|x_{1}-x_{2}\right|\left(1-x_{3}\right)} M_{B_{s}}, 1 / b_{1}, 1 / b_{2}\right\} . \tag{A8}
\end{align*}
$$

The functions $h$ in the decay amplitudes consist of two parts: one is the jet function $S_{t}\left(x_{i}\right)$ derived by the threshold re-summation[46], the other is the propagator of virtual quark and gluon. They are defined by

$$
\begin{align*}
h_{e}\left(x_{1}, x_{3}, b_{1}, b_{3}\right)= & {\left[\theta\left(b_{1}-b_{3}\right) I_{0}\left(\sqrt{x} M_{B_{s}} b_{3}\right) K_{0}\left(\sqrt{x_{3}} M_{B_{s}} b_{1}\right)\right.}  \tag{A9}\\
& \left.+\theta\left(b_{3}-b_{1}\right) I_{0}\left(\sqrt{x_{3}} M_{B_{s}} b_{1}\right) K_{0}\left(\sqrt{x_{3}} M_{B_{s}} b_{3}\right)\right] K_{0}\left(\sqrt{x_{1} x_{3}} M_{B_{s}} b_{1}\right) S_{t}\left(x_{3}\right), \\
h_{n}\left(x_{1}, x_{2}, x_{3}, b_{1}, b_{2}\right)= & {\left[\theta\left(b_{2}-b_{1}\right) K_{0}\left(\sqrt{x_{1} x_{3}} M_{B_{s}} b_{2}\right) I_{0}\left(\sqrt{x_{1} x_{3}} M_{B_{s}} b_{1}\right)\right.} \\
& \left.+\theta\left(b_{1}-b_{2}\right) K_{0}\left(\sqrt{x_{1} x_{3}} M_{B_{s}} b_{1}\right) I_{0}\left(\sqrt{x_{1} x_{3}} M_{B_{s}} b_{2}\right)\right] \\
& \times \begin{cases}\frac{i \pi}{2} H_{0}^{(1)}\left(\sqrt{\left(x_{2}-x_{1}\right) x_{3}} M_{B_{s}} b_{2}\right), & x_{1}-x_{2}<0 \\
K_{0}\left(\sqrt{\left(x_{1}-x_{2}\right) x_{3}} M_{B_{s}} b_{2}\right), & x_{1}-x_{2}>0\end{cases} \tag{A10}
\end{align*}
$$

$$
\begin{align*}
& h_{a}\left(x_{2}, x_{3}, b_{2}, b_{3}\right)=\left(\frac{i \pi}{2}\right)^{2} S_{t}\left(x_{3}\right)\left[\theta\left(b_{2}-b_{3}\right) H_{0}^{(1)}\left(\sqrt{x_{3}} M_{B_{s}} b_{2}\right) J_{0}\left(\sqrt{x_{3}} M_{B_{s}} b_{3}\right)\right. \\
& \left.+\theta\left(b_{3}-b_{2}\right) H_{0}^{(1)}\left(\sqrt{x_{3}} M_{B_{s}} b_{3}\right) J_{0}\left(\sqrt{x_{3}} M_{B_{s}} b_{2}\right)\right] H_{0}^{(1)}\left(\sqrt{x_{2} x_{3}} M_{B_{s}} b_{2}\right)(, A 11 \\
& h_{n a}\left(x_{1}, x_{2}, x_{3}, b_{1}, b_{2}\right)=\frac{i \pi}{2}\left[\theta\left(b_{1}-b_{2}\right) H_{0}^{(1)}\left(\sqrt{x_{2}\left(1-x_{3}\right)} M_{B_{s}} b_{1}\right) J_{0}\left(\sqrt{x_{2}\left(1-x_{3}\right)} M_{B_{s}} b_{2}\right)\right. \\
& \left.+\theta\left(b_{2}-b_{1}\right) H_{0}^{(1)}\left(\sqrt{x_{2}\left(1-x_{3}\right)} M_{B_{s}} b_{2}\right) J_{0}\left(\sqrt{x_{2}\left(1-x_{3}\right)} M_{B_{s}} b_{1}\right)\right] \\
& \times K_{0}\left(\sqrt{1-\left(1-x_{1}-x_{2}\right) x_{3}} M_{B_{s}} b_{1}\right),  \tag{A12}\\
& h_{n a}^{\prime}\left(x_{1}, x_{2}, x_{3}, b_{1}, b_{2}\right)=\frac{i \pi}{2}\left[\theta\left(b_{1}-b_{2}\right) H_{0}^{(1)}\left(\sqrt{x_{2}\left(1-x_{3}\right)} M_{B_{s}} b_{1}\right) J_{0}\left(\sqrt{x_{2}\left(1-x_{3}\right)} M_{B_{s}} b_{2}\right)\right. \\
& \left.+\theta\left(b_{2}-b_{1}\right) H_{0}^{(1)}\left(\sqrt{x_{2}\left(1-x_{3}\right)} M_{B_{s}} b_{2}\right) J_{0}\left(\sqrt{x_{2}\left(1-x_{3}\right)} M_{B_{s}} b_{1}\right)\right] \\
& \times\left\{\begin{array}{ll}
\frac{i \pi}{2} H_{0}^{(1)}\left(\sqrt{\left(x_{2}-x_{1}\right)\left(1-x_{3}\right)} M_{B_{s}} b_{1}\right), & x_{1}-x_{2}<0 \\
K_{0}\left(\sqrt{\left(x_{1}-x_{2}\right)\left(1-x_{3}\right)} M_{B_{s}} b_{1}\right), & x_{1}-x_{2}>0
\end{array}, ~\right. \tag{A13}
\end{align*}
$$

where $H_{0}^{(1)}(z)=\mathrm{J}_{0}(z)+i \mathrm{Y}_{0}(z)$.
The $S_{t}$ re-sums the threshold logarithms $\ln ^{2} x$ appearing in the hard kernels to all orders and it has been parameterized as

$$
\begin{equation*}
S_{t}(x)=\frac{2^{1+2 c} \Gamma(3 / 2+c)}{\sqrt{\pi} \Gamma(1+c)}[x(1-x)]^{c}, \tag{A14}
\end{equation*}
$$

with $c=0.4$. In the nonfactorizable contributions, $S_{t}(x)$ gives a very small numerical effect to the amplitude [47]. Therefore, we drop $S_{t}(x)$ in $h_{n}$ and $h_{n a}$.

The evolution factors $E_{e}^{(1)}$ and $E_{a}^{(1)}$ entering in the expressions for the matrix elements (see section 3) are given by

$$
\begin{array}{ll}
E_{e}(t)=\alpha_{s}(t) \exp \left[-S_{B}(t)-S_{3}(t)\right], & E_{e}^{\prime}(t)=\left.\alpha_{s}(t) \exp \left[-S_{B}(t)-S_{2}(t)-S_{3}(t)\right]\right|_{b_{1}=b_{3}}, \\
E_{a}(t)=\alpha_{s}(t) \exp \left[-S_{2}(t)-S_{3}(t)\right], & E_{a}^{\prime}(t)=\left.\alpha_{s}(t) \exp \left[-S_{B}(t)-S_{2}(t)-S_{3}(t)\right]\right|_{b_{2}=b_{3}},( \tag{A16}
\end{array}
$$

in which the Sudakov exponents are defined as

$$
\begin{align*}
S_{B}(t) & =s\left(x_{1} \frac{M_{B_{s}}}{\sqrt{2}}, b_{1}\right)+\frac{5}{3} \int_{1 / b_{1}}^{t} \frac{d \bar{\mu}}{\bar{\mu}} \gamma_{q}\left(\alpha_{s}(\bar{\mu})\right)  \tag{A17}\\
S_{2}(t) & =s\left(x_{2} \frac{M_{B_{s}}}{\sqrt{2}}, b_{2}\right)+s\left(\left(1-x_{2}\right) \frac{M_{B_{s}}}{\sqrt{2}}, b_{2}\right)+2 \int_{1 / b_{2}}^{t} \frac{d \bar{\mu}}{\bar{\mu}} \gamma_{q}\left(\alpha_{s}(\bar{\mu})\right) \tag{A18}
\end{align*}
$$

with the quark anomalous dimension $\gamma_{q}=-\alpha_{s} / \pi$. Replacing the kinematic variables of $M_{2}$ to $M_{3}$ in $S_{2}$, we can get the expression for $S_{3}$. The explicit form for the function $s(Q, b)$ is:

$$
\begin{align*}
s(Q, b)= & \frac{A^{(1)}}{2 \beta_{1}} \hat{q} \ln \left(\frac{\hat{q}}{\hat{b}}\right)-\frac{A^{(1)}}{2 \beta_{1}}(\hat{q}-\hat{b})+\frac{A^{(2)}}{4 \beta_{1}^{2}}\left(\frac{\hat{q}}{\hat{b}}-1\right)-\left[\frac{A^{(2)}}{4 \beta_{1}^{2}}-\frac{A^{(1)}}{4 \beta_{1}} \ln \left(\frac{e^{2 \gamma_{E}-1}}{2}\right)\right] \ln \left(\frac{\hat{q}}{\hat{b}}\right) \\
& +\frac{A^{(1)} \beta_{2}}{4 \beta_{1}^{3}} \hat{q}\left[\frac{\ln (2 \hat{q})+1}{\hat{q}}-\frac{\ln (2 \hat{b})+1}{\hat{b}}\right]+\frac{A^{(1)} \beta_{2}}{8 \beta_{1}^{3}}\left[\ln ^{2}(2 \hat{q})-\ln ^{2}(2 \hat{b})\right], \tag{A19}
\end{align*}
$$

where the variables are defined by

$$
\begin{equation*}
\hat{q} \equiv \ln [Q /(\sqrt{2} \Lambda)], \quad \hat{b} \equiv \ln [1 /(b \Lambda)], \tag{A20}
\end{equation*}
$$

and the coefficients $A^{(i)}$ and $\beta_{i}$ are

$$
\begin{array}{r}
\beta_{1}=\frac{33-2 n_{f}}{12}, \quad \beta_{2}=\frac{153-19 n_{f}}{24}, \\
A^{(1)}=\frac{4}{3}, \quad A^{(2)}=\frac{67}{9}-\frac{\pi^{2}}{3}-\frac{10}{27} n_{f}+\frac{8}{3} \beta_{1} \ln \left(\frac{1}{2} e^{\gamma_{E}}\right), \tag{A21}
\end{array}
$$

$n_{f}$ is the number of the quark flavors and $\gamma_{E}$ is the Euler constant. We will use the one-loop running coupling constant, i.e. we pick up the four terms in the first line of the expression for the function $s(Q, b)$.

## APPENDIX B: ANALYTIC FORMULAE FOR THE $B_{s} \rightarrow P P$ DECAY AMPLITUDES

Before we give the analytic formulae for $B_{s} \rightarrow P P$ decays, we analyze the amplitudes in some special cases which can simplify the formulae.

- In the non-factorizable emission diagrams, the formulae can be simplified if the emission meson $M_{2}$ is $\pi, \eta$ or $\eta^{\prime}$. Their distribution amplitudes $\phi^{A}(x)$ and $\phi^{P}(x)$ are symmetric and $\phi^{T}(x)$ is antisymmetric under the change $x \rightarrow 1-x$. From Eq. (54) we can see that the amplitude is identically zero for the $(V-A)(V+A)$ operators; From Eq. (53) and Eq. (55)) we can see that the $(V-A)(V-A)$ contribution is the same as the $(S-P)(S+P)$ contribution which can be simplified as

$$
\begin{align*}
M_{B_{s} \rightarrow M_{3}}^{L L}\left(a_{i}\right)= & 32 \pi C_{F} M_{B_{s}}^{4} / \sqrt{6} \int_{0}^{1} d x_{1} d x_{2} d x_{3} \int_{0}^{\infty} b_{1} d b_{1} b_{2} d b_{2} \phi_{B}\left(x_{1}, b_{1}\right) \phi_{2}^{A}\left(x_{2}\right) \\
& \times h_{n}\left(x_{1}, x_{2}, x_{3}, b_{1}, b_{2}\right)\left[-x_{3} \phi_{3}^{A}\left(x_{3}\right)+2 r_{3} x_{3} \phi_{3}^{T}\left(x_{3}\right)\right] a_{i}\left(t_{b}^{\prime}\right) E_{e}^{\prime}\left(t_{b}^{\prime}\right) \\
= & M_{B_{s} \rightarrow M_{3}}^{S P}\left(a_{i}\right) . \tag{B1}
\end{align*}
$$

- In the annihilation factorizable diagrams, the $(V-A)(V-A)$ and $(V-A)(V+A)$ operators give the same contribution, both from the vector current. If the final state mesons are charge conjugate with each other, the $(V-A)(V-A)$ and $(V-A)(V+A)$ operators give identically zero contributions due to the conservation of the vector current. Such operators do not contribute to the $B_{s} \rightarrow K \pi$ decay either, in the $S U(3)$ limit. The $S U(3)$ symmetry breaking, i.e. the difference in the distribution amplitudes of $\pi$ and $K$ meson, can
induce small deviations from zero. We expect this kind of operators can not give important contributions to the branching ratios.
- In the nonfactorizable annihilation amplitudes of $\bar{B}_{s} \rightarrow \pi \pi, B_{s} \rightarrow \eta(\bar{n} n) \eta(\bar{n} n)$ and $B_{s} \rightarrow \eta(\bar{s} s) \eta(\bar{s} s)$, the $(V-A)(V-A)$ operators and $(S-P)(S+P)$ operators give equal contributions as can be seen from the factorization formulae $M_{\text {ann }}$ by making $x_{2} \leftrightarrow 1-x_{3}$.

## 1. The case without $\eta^{(\prime)}$

Tree operator dominant decays:

$$
\begin{align*}
A\left(\bar{B}_{s}^{0} \rightarrow \pi^{-} K^{+}\right)= & \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u d}^{*}\left\{f_{\pi} F_{B_{s} \rightarrow K}^{L L}\left[a_{1}\right]+M_{B_{s} \rightarrow K}^{L L}\left[C_{1}\right]\right\} \\
& -\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t d}^{*}\left\{f_{\pi} F_{B_{s} \rightarrow K}^{L L}\left[a_{4}+a_{10}\right]+f_{\pi} F_{B_{s} \rightarrow K}^{S P}\left[a_{6}+a_{8}\right]\right. \\
& +M_{B_{s} \rightarrow K}^{L L}\left[C_{3}+C_{9}\right]+f_{B_{s}} F_{\text {ann }}^{L L}\left[a_{4}-\frac{1}{2} a_{10}\right]+f_{B_{s}} F_{a n n}^{S P}\left[a_{6}-\frac{1}{2} a_{8}\right] \\
& \left.+M_{a n n}^{L L}\left[C_{3}-\frac{1}{2} C_{9}\right]+M_{\text {ann }}^{L R}\left[C_{5}-\frac{1}{2} C_{7}\right]\right\},  \tag{B2}\\
\sqrt{2} A\left(\bar{B}_{s}^{0} \rightarrow \pi^{0} K^{0}\right)= & \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u d}^{*}\left\{f_{\pi} F_{B_{s} \rightarrow K}^{L L}\left[a_{2}\right]+M_{B_{s} \rightarrow K}^{L L}\left[C_{2}\right]\right\} \\
& -\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t d}^{*}\left\{f_{\pi} F_{B_{s} \rightarrow K}^{L L}\left[-a_{4}-\frac{3}{2} a_{7}+\frac{3}{2} a_{9}+\frac{1}{2} a_{10}\right]\right. \\
& +f_{\pi} F_{B_{s} \rightarrow K}^{S P}\left[-a_{6}+\frac{1}{2} a_{8}\right]+M_{B_{s} \rightarrow K}^{L L}\left[-C_{3}+\frac{3}{2} C_{8}+\frac{1}{2} C_{9}+\frac{3}{2} C_{10}\right] \\
& +f_{B_{s}} F_{a n n}^{S P}\left[-a_{6}+\frac{1}{2} a_{8}\right]+f_{B_{s}} F_{a n n}^{L L}\left[-a_{4}+\frac{1}{2} a_{10}\right] \\
& \left.+M_{a n n}^{L L}\left[-C_{3}+\frac{1}{2} C_{9}\right]+M_{a n n}^{L R}\left[-C_{5}+\frac{1}{2} C_{7}\right]\right\} . \tag{B3}
\end{align*}
$$

Pure annihilation type decays:

$$
\begin{align*}
A\left(\bar{B}_{s}^{0} \rightarrow \pi^{+} \pi^{-}\right) & =\sqrt{2} A\left(\bar{B}_{s}^{0} \rightarrow \pi^{0} \pi^{0}\right) \\
& =\frac{G_{F}}{\sqrt{2}} V_{u b} V_{u s}^{*} M_{a n n}^{L L}\left[C_{2}\right]-\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*} M_{a n n}^{L L}\left[2 C_{4}+2 C_{6}+\frac{1}{2} C_{8}+\frac{1}{2} C_{10}\right] . \tag{B4}
\end{align*}
$$

QCD penguin operator dominant decays:

$$
\begin{align*}
& A\left(\bar{B}_{s}^{0} \rightarrow K^{-} K^{+}\right)=\frac{G_{F}}{\sqrt{2}} V_{u b} V_{u s}^{*}\left\{f_{K} F_{B_{s} \rightarrow K}^{L L}\left[a_{1}\right]+M_{B_{s} \rightarrow K}^{L L}\left[C_{1}\right]+M_{\text {ann }}^{L L}\left[C_{2}\right]\right\} \\
& -\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*}\left\{f_{K} F_{B_{s} \rightarrow K}^{L L}\left[a_{4}+a_{10}\right]+f_{K} F_{B_{s} \rightarrow K}^{S P}\left[a_{6}+a_{8}\right]\right. \\

& A\left(\bar{B}_{s}^{0} \rightarrow \bar{K}^{0} K^{0}\right)=-\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*}\left\{f_{K} F_{B_{s} \rightarrow K}^{L L}\left[a_{4}-\frac{1}{2} a_{10}\right]+f_{K} F_{B_{s} \rightarrow K}^{S P}\left[a_{6}-\frac{1}{2} a_{8}\right]\right. \\
& +M_{B_{s} \rightarrow K}^{L L}\left[C_{3}-\frac{1}{2} C_{9}\right]+M_{B_{s} \rightarrow K}^{L R}\left[C_{5}-\frac{1}{2} C_{7}\right]+f_{B_{s}} F_{\text {ann }}^{S P}\left[a_{6}-\frac{1}{2} a_{8}\right] \\
& +M_{\text {ann }}^{L L}\left[C_{3}-\frac{1}{2} C_{9}+C_{4}-\frac{1}{2} C_{10}\right]+M_{\text {ann }}^{L R}\left[C_{5}-\frac{1}{2} C_{7}\right]  \tag{B6}\\
& \left.+M_{\text {ann }}^{L L}\left[C_{4}-\frac{1}{2} C_{10}\right]_{K^{0} \leftrightarrow \bar{K}^{0}}+\left(M_{\text {ann }}^{S P}\left[C_{6}-\frac{1}{2} C_{8}\right]+\left[K^{0} \leftrightarrow \bar{K}^{0}\right]\right)\right\},
\end{align*}
$$

2. The case with $\eta^{(1)}$

As discussed in the last section, we use the quark flavor basis for the mixing of $\eta$ and $\eta$. So we divide the amplitudes into the $\eta_{n}=(\bar{u} u+\bar{d} d) / \sqrt{2}$ and $\bar{s} s$ component.

$$
\begin{align*}
\sqrt{2} A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} K^{0}\right)= & \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u d}^{*}\left\{f_{n} F_{B_{s} \rightarrow K}^{L L}\left[a_{2}\right]+M_{B_{s} \rightarrow K}^{L L}\left[C_{2}\right]\right\} \\
& -\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t d}^{*}\left\{f_{n} F_{B_{s} \rightarrow K}^{S P}\left[a_{6}-\frac{1}{2} a_{8}\right]+f_{B_{s}} F_{a n n}^{L L}\left[a_{4}-\frac{1}{2} a_{10}\right]\right. \\
& +f_{n} F_{B_{s} \rightarrow K}^{L L}\left[2 a_{3}+a_{4}-2 a_{5}-\frac{1}{2} a_{7}+\frac{1}{2} a_{9}-\frac{1}{2} a_{10}\right] \\
& +M_{B_{s} \rightarrow K}^{L L}\left[C_{3}+2 C_{4}+2 C_{6}+\frac{1}{2} C_{8}-\frac{1}{2} C_{9}+\frac{1}{2} C_{10}\right] \\
& \left.+f_{B_{s}} F_{a n n}^{S P}\left[a_{6}-\frac{1}{2} a_{8}\right]+M_{a n n}^{L L}\left[C_{3}-\frac{1}{2} C_{9}\right]+M_{a n n}^{L R}\left[C_{5}-\frac{1}{2} C_{7}\right]\right\}, \tag{B7}
\end{align*}
$$

$$
\begin{align*}
A\left(\bar{B}_{s}^{0} \rightarrow K^{0} \eta_{s}\right)= & -\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t d}^{*}\left\{f_{s} F_{B_{s} \rightarrow K}^{L L}\left[a_{3}-a_{5}+\frac{1}{2} a_{7}-\frac{1}{2} a_{9}\right]+f_{K} F_{B_{s} \rightarrow \eta_{s}}^{L L}\left[a_{4}-\frac{1}{2} a_{10}\right]\right. \\
& +f_{K} F_{B_{s} \rightarrow \eta_{s}}^{S P}\left[a_{6}-\frac{1}{2} a_{8}\right]+M_{B_{s} \rightarrow K}^{L L}\left[C_{4}+C_{6}-\frac{1}{2} C_{8}-\frac{1}{2} C_{10}\right] \\
& +M_{B_{s} \rightarrow \eta_{s}}^{L L}\left[C_{3}-\frac{1}{2} C_{9}\right]+M_{B_{s} \rightarrow \eta_{s}}^{L R}\left[C_{5}-\frac{1}{2} C_{7}\right]+f_{B_{s}} F_{a n n}^{L L}\left[a_{4}-\frac{1}{2} a_{10}\right] \\
& \left.+f_{B_{s}} F_{a n n}^{S P}\left[a_{6}-\frac{1}{2} a_{8}\right]+M_{a n n}^{L L}\left[C_{3}-\frac{1}{2} C_{9}\right]+M_{a n n}^{L R}\left[C_{5}-\frac{1}{2} C_{7}\right]\right\} . \tag{B8}
\end{align*}
$$

The decay amplitudes for the physical states are then

$$
\begin{align*}
& A\left(\bar{B}_{s} \rightarrow \eta K^{0}\right)=A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} K^{0}\right) \cos \phi-A\left(\bar{B}_{s}^{0} \rightarrow K^{0} \eta_{s}\right) \sin \phi,  \tag{B9}\\
& A\left(\bar{B}_{s} \rightarrow \eta^{\prime} K^{0}\right)=A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} K^{0}\right) \sin \phi+A\left(\bar{B}_{s}^{0} \rightarrow K^{0} \eta_{s}\right) \cos \phi . \tag{B10}
\end{align*}
$$

For $\bar{B}_{s} \rightarrow \eta^{(\prime)} \pi^{0}$ the decay amplitudes are defined similarly,

$$
\begin{align*}
& A\left(\bar{B}_{s} \rightarrow \pi^{0} \eta\right)=A\left(\bar{B}_{s}^{0} \rightarrow \pi^{0} \eta_{n}\right) \cos \phi-A\left(\bar{B}_{s}^{0} \rightarrow \pi^{0} \eta_{s}\right) \sin \phi,  \tag{B11}\\
& A\left(\bar{B}_{s} \rightarrow \pi^{0} \eta^{\prime}\right)=A\left(\bar{B}_{s}^{0} \rightarrow \pi^{0} \eta_{n}\right) \sin \phi+A\left(\bar{B}_{s}^{0} \rightarrow \pi^{0} \eta_{s}\right) \cos \phi, \tag{B12}
\end{align*}
$$

where

$$
\begin{align*}
A\left(\bar{B}_{s}^{0} \rightarrow \pi^{0} \eta_{n}\right)= & \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u s}^{*}\left\{f_{B_{s}} F_{\text {ann }}^{L L}\left[a_{2}\right]+M_{a n n}^{L L}\left[C_{2}\right]\right\} \\
& -\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*}\left\{f_{B_{s}} F_{a n n}^{L L}\left[\frac{3}{2} a_{9}+\frac{3}{2} a_{7}\right]+M_{a n n}^{S P}\left[\frac{3}{2} C_{8}\right]+M_{a n n}^{L L}\left[\frac{3}{2} C_{10}\right]\right\}, \tag{B13}
\end{align*}
$$

and

$$
\begin{align*}
\sqrt{2} A\left(\bar{B}_{s}^{0} \rightarrow \pi^{0} \eta_{s}\right)= & \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u s}^{*}\left\{f_{\pi} F_{B_{s} \rightarrow \eta_{s}}^{L L}\left[a_{2}\right]+M_{B_{s} \rightarrow \eta_{s}}^{L L}\left[C_{2}\right]\right\} \\
& -\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*}\left\{f_{\pi} F_{B_{s} \rightarrow \eta_{s}}^{L L}\left[\frac{3}{2} a_{9}-\frac{3}{2} a_{7}\right]+M_{B_{s} \rightarrow \eta_{s}}^{L L}\left[\frac{3}{2} C_{8}+\frac{3}{2} C_{10}\right]\right\} . \tag{B14}
\end{align*}
$$

For $\bar{B}_{s} \rightarrow \eta^{(\prime)} \eta^{(\prime)}$, we have

$$
\begin{align*}
A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} \eta_{n}\right)= & \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u s}^{*} M_{a n n}^{L L}\left[C_{2}\right]-\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*} M_{a n n}^{L L}\left[2 C_{4}+2 C_{6}+\frac{1}{2} C_{8}+\frac{1}{2} C_{10}\right], \quad(\mathrm{B} 1  \tag{B15}\\
\sqrt{2} A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} \eta_{s}\right)= & \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u s}^{*}\left\{f_{n} F_{B_{s} \rightarrow \eta_{s}}^{L L}\left[a_{2}\right]+M_{B_{s} \rightarrow \eta_{s}}^{L L}\left[C_{2}\right]\right\} \\
& -\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*}\left\{f_{n} F_{B_{s} \rightarrow \eta_{s}}^{L L}\left[2 a_{3}-2 a_{5}-\frac{1}{2} a_{7}+\frac{1}{2} a_{9}\right]\right. \\
& \left.+M_{B_{s} \rightarrow \eta_{s}}^{L L}\left[2 C_{4}+2 C_{6}+\frac{1}{2} C_{8}+\frac{1}{2} C_{10}\right]\right\},  \tag{B16}\\
A\left(\bar{B}_{s}^{0} \rightarrow \eta_{s} \eta_{s}\right)= & -\sqrt{2} G_{F} V_{t b} V_{t s}^{*}\left\{f_{s} F_{B_{s} \rightarrow \eta_{s}}^{L L}\left[a_{3}+a_{4}-a_{5}+\frac{1}{2} a_{7}-\frac{1}{2} a_{9}-\frac{1}{2} a_{10}\right]\right. \\
& +f_{s} F_{B_{s} \rightarrow \eta_{s}}^{S P}\left[a_{6}-\frac{1}{2} a_{8}\right]+M_{B_{s} \rightarrow \eta_{s}}^{L L}\left[C_{3}+C_{4}+C_{6}-\frac{1}{2} C_{8}-\frac{1}{2} C_{9}-\frac{1}{2} C_{10}\right] \\
& \left.+f_{B_{s}} F_{a n n}^{S P}\left[a_{6}-\frac{1}{2} a_{8}\right]+M_{a n n}^{L L}\left[C_{3}+C_{4}+C_{6}-\frac{1}{2} C_{8}-\frac{1}{2} C_{9}-\frac{1}{2} C_{10}\right]\right\}
\end{align*}
$$

The decay amplitudes for the physical states are then

$$
\begin{aligned}
\sqrt{2} A\left(\bar{B}_{s} \rightarrow \eta \eta\right) & =A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} \eta_{n}\right) \cos ^{2} \phi+A\left(\bar{B}_{s}^{0} \rightarrow \eta_{s} \eta_{s}\right) \sin ^{2} \phi-\sin (2 \phi) A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} \eta_{s}\right)(\mathrm{B} 18) \\
A\left(\bar{B}_{s} \rightarrow \eta \eta^{\prime}\right) & =\left[A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} \eta_{n}\right)-A\left(\bar{B}_{s}^{0} \rightarrow \eta_{s} \eta_{s}\right)\right] \cos \phi \sin \phi+A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} \eta_{s}\right) \cos (2 \phi \text { 久(B19) } \\
\sqrt{2} A\left(\bar{B}_{s} \rightarrow \eta^{\prime} \eta^{\prime}\right) & =A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} \eta_{n}\right) \sin ^{2} \phi+A\left(\bar{B}_{s}^{0} \rightarrow \eta_{s} \eta_{s}\right) \cos ^{2} \phi+\sin (2 \phi) A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} \eta_{s}\right)(\mathrm{B} 20)
\end{aligned}
$$

## APPENDIX C: ANALYTIC FORMULAE FOR THE $B_{s} \rightarrow P V$ DECAY AMPLITUDES

## 1. The tree dominant decays

$$
\begin{align*}

& -M_{B_{s} \rightarrow K^{*}}^{L R}\left[C_{5}-\frac{1}{2} C_{7}\right]-f_{B_{s}} F_{\text {ann }}^{S P}\left[a_{6}-\frac{1}{2} a_{8}\right] \\
& +M_{\text {ann }}^{L L}\left[C_{3}-\frac{1}{2} C_{9}+C_{4}-\frac{1}{2} C_{10}\right]+M_{\text {ann }}^{L L}\left[C_{4}-\frac{1}{2} C_{10}\right]_{K^{*} \leftrightarrow K} \\
& -M_{\text {ann }}^{L R}\left[C_{5}-\frac{1}{2} C_{7}\right]-\left(M_{\text {ann }}^{S P}\left[C_{6}-\frac{1}{2} C_{8}\right]+\left[K^{*} \leftrightarrow K\right]\right) \\
& \left.+f_{B_{s}} F_{\text {ann }}^{L L}\left[a_{3}-a_{5}+\frac{1}{2} a_{7}-\frac{1}{2} a_{9}\right]_{K^{*} \leftrightarrow K}\right\},  \tag{C12}\\
& A\left(\bar{B}_{s}^{0} \rightarrow \bar{K}^{* 0} K^{0}\right)=-\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*}\left\{f_{K^{*}} F_{B_{s} \rightarrow K}^{L L}\left[a_{4}-\frac{1}{2} a_{10}\right]+M_{B_{s} \rightarrow K}^{L L}\left[C_{3}-\frac{1}{2} C_{9}\right]\right. \\
& +M_{B_{s} \rightarrow K}^{L R}\left[C_{5}-\frac{1}{2} C_{7}\right]+f_{B_{s}} F_{\text {ann }}^{L L}\left[a_{3}+a_{4}-a_{5}+\frac{1}{2} a_{7}-\frac{1}{2} a_{9}-\frac{1}{2} a_{10}\right] \\
& +f_{B_{s}} F_{\text {ann }}^{S P}\left[a_{6}-\frac{1}{2} a_{8}\right]+M_{\text {ann }}^{L L}\left[C_{3}-\frac{1}{2} C_{9}+C_{4}-\frac{1}{2} C_{10}\right] \\
& +M_{\text {ann }}^{L R}\left[C_{5}-\frac{1}{2} C_{7}\right]-\left(M_{\text {ann }}^{S P}\left[C_{6}-\frac{1}{2} C_{8}\right]+\left[K^{*} \leftrightarrow K\right]\right)  \tag{C13}\\
& \left.+f_{B_{s}} F_{a n n}^{L L}\left[a_{3}-a_{5}+\frac{1}{2} a_{7}-\frac{1}{2} a_{9}\right]_{K^{*} \leftrightarrow K}+M_{a n n}^{L L}\left[C_{4}-\frac{1}{2} C_{10}\right]_{K^{*} \leftrightarrow K}\right\} . \\
& A\left(\bar{B}_{s}^{0} \rightarrow K^{0} \phi\right)=-\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t d}^{*}\left\{f_{\phi} F_{B_{s} \rightarrow K}^{L L}\left[a_{3}+a_{5}-\frac{1}{2} a_{7}-\frac{1}{2} a_{9}\right]+f_{K} F_{B_{s} \rightarrow \phi}^{L L}\left[a_{4}-\frac{1}{2} a_{10}\right]\right. \\
& -f_{K} F_{B_{s} \rightarrow \phi}^{S P}\left[a_{6}-\frac{1}{2} a_{8}\right]+M_{B_{s} \rightarrow K}^{L L}\left[C_{4}-\frac{1}{2} C_{10}\right]+M_{B_{s} \rightarrow \phi}^{L L}\left[C_{3}-\frac{1}{2} C_{9}\right] \\
& -M_{B_{s} \rightarrow K}^{S P}\left[C_{6}-\frac{1}{2} C_{8}\right]-M_{B_{s} \rightarrow \phi}^{L R}\left[C_{5}-\frac{1}{2} C_{7}\right]+f_{B_{s}} F_{\text {ann }}^{L L}\left[a_{4}-\frac{1}{2} a_{10}\right] \\
& \left.-f_{B_{s}} F_{a n n}^{S P}\left[a_{6}-\frac{1}{2} a_{8}\right]+M_{a n n}^{L L}\left[C_{3}-\frac{1}{2} C_{9}\right]-M_{a n n}^{L R}\left[C_{5}-\frac{1}{2} C_{7}\right]\right\} . \tag{C14}
\end{align*}
$$

## 4. The Electroweak penguin dominant decays

$$
\begin{align*}
\sqrt{2} A\left(\bar{B}_{s}^{0} \rightarrow \pi^{0} \phi\right)= & \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u s}^{*}\left\{f_{\pi} F_{B_{s} \rightarrow \phi}^{L L}\left[a_{2}\right]+M_{B_{s} \rightarrow \phi}^{L L}\left[C_{2}\right]\right\} \\
& -\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*}\left\{f_{\pi} F_{B_{s} \rightarrow \phi}^{L L}\left[\frac{3}{2} a_{9}-\frac{3}{2} a_{7}\right]+M_{B_{s} \rightarrow \phi}^{L L}\left[\frac{3}{2} C_{8}+\frac{3}{2} C_{10}\right]\right\} . \tag{C15}
\end{align*}
$$

5. The decays involving $\eta$ and $\eta^{\prime}$

$$
\begin{align*}
\sqrt{2} A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} K^{* 0}\right)= & \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u d}^{*}\left\{f_{n} F_{B_{s} \rightarrow K^{*}}^{L L}\left[a_{2}\right]+M_{B_{s} \rightarrow K^{*}}^{L L}\left[C_{2}\right]\right\} \\
& -\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t d}^{*}\left\{f_{n} F_{B_{s} \rightarrow K^{*}}^{L L}\left[2 a_{3}+a_{4}-2 a_{5}-\frac{1}{2} a_{7}+\frac{1}{2} a_{9}-\frac{1}{2} a_{10}\right]\right. \\
& -f_{n} F_{B_{s} \rightarrow K^{*}}^{S P}\left[a_{6}-\frac{1}{2} a_{8}\right]+M_{B_{s} \rightarrow K^{*}}^{L L}\left[C_{3}+2 C_{4}-\frac{1}{2} C_{9}+\frac{1}{2} C_{10}\right] \\
& +M_{B_{s} \rightarrow K^{*}}^{S P}\left[2 C_{6}+\frac{1}{2} C_{8}\right]+f_{B_{s}} F_{a n n}^{L L}\left[a_{4}-\frac{1}{2} a_{10}\right]+f_{B_{s}} F_{a n n}^{S P}\left[a_{6}-\frac{1}{2} a_{8}\right] \\
& \left.+M_{a n n}^{L L}\left[C_{3}-\frac{1}{2} C_{9}\right]+M_{a n n}^{L R}\left[C_{5}-\frac{1}{2} C_{7}\right]\right\},  \tag{C16}\\
A\left(\bar{B}_{s}^{0} \rightarrow K^{* 0} \eta_{s}\right)= & -\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t d}^{*}\left\{f_{s} F_{B_{s} \rightarrow K^{*}}^{L L}\left[a_{3}-a_{5}+\frac{1}{2} a_{7}-\frac{1}{2} a_{9}\right]+f_{K^{*}} F_{B_{s} \rightarrow \eta_{s}}^{L L}\left[a_{4}-\frac{1}{2} a_{10}\right]\right. \\
& +M_{B_{s} \rightarrow K^{*}}^{L L}\left[C_{4}-\frac{1}{2} C_{10}\right]+M_{B_{s} \rightarrow \eta_{s}}^{L L}\left[C_{3}-\frac{1}{2} C_{9}\right] \\
& +M_{B_{s} \rightarrow K^{*}}^{S P}\left[C_{6}-\frac{1}{2} C_{8}\right]+M_{B_{s} \rightarrow \eta_{s}}^{L R}\left[C_{5}-\frac{1}{2} C_{7}\right]+f_{B_{s}} F_{a n n}^{L L}\left[a_{4}-\frac{1}{2} a_{10}\right] \\
& \left.+f_{B_{s}} F_{a n n}^{S P}\left[a_{6}-\frac{1}{2} a_{8}\right]+M_{a n n}^{L L}\left[C_{3}-\frac{1}{2} C_{9}\right]+M_{a n n}^{L R}\left[C_{5}-\frac{1}{2} C_{7}\right]\right\} . \quad(\mathrm{C} 17), \tag{C17}
\end{align*}
$$

The decay amplitudes for the physical states are then

$$
\begin{align*}
& A\left(\bar{B}_{s} \rightarrow \eta K^{* 0}\right)=A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} K^{* 0}\right) \cos \phi-A\left(\bar{B}_{s}^{0} \rightarrow \eta_{s} K^{* 0}\right) \sin \phi,  \tag{C18}\\
& A\left(\bar{B}_{s} \rightarrow \eta^{\prime} K^{* 0}\right)=A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} K^{* 0}\right) \sin \phi+A\left(\bar{B}_{s}^{0} \rightarrow \eta_{s} K^{* 0}\right) \cos \phi . \tag{C19}
\end{align*}
$$

For $\bar{B}_{s} \rightarrow \eta^{(\prime)} \rho^{0}$ the decay amplitudes are defined similarly,

$$
\begin{align*}
& A\left(\bar{B}_{s} \rightarrow \rho^{0} \eta\right)=A\left(\bar{B}_{s}^{0} \rightarrow \rho^{0} \eta_{n}\right) \cos \phi-A\left(\bar{B}_{s}^{0} \rightarrow \rho^{0} \eta_{s}\right) \sin \phi,  \tag{C20}\\
& A\left(\bar{B}_{s} \rightarrow \rho^{0} \eta^{\prime}\right)=A\left(\bar{B}_{s}^{0} \rightarrow \rho^{0} \eta_{n}\right) \sin \phi+A\left(\bar{B}_{s}^{0} \rightarrow \rho^{0} \eta_{s}\right) \cos \phi, \tag{C21}
\end{align*}
$$

where

$$
\begin{align*}
2 A\left(\bar{B}_{s}^{0} \rightarrow \rho^{0} \eta_{n}\right)= & -\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*}\left\{f_{B_{s}} F_{\text {ann }}^{L L}\left[\frac{3}{2} a_{9}-\frac{3}{2} a_{7}\right]+M_{\text {ann }}^{L L}\left[\frac{3}{2} C_{10}\right]-M_{a n n}^{S P}\left[\frac{3}{2} C_{8}\right]\right\} \\
& +\frac{G_{F}}{\sqrt{2}} V_{u b} V_{u s}^{*}\left\{f_{B_{s}} F_{\text {ann }}^{L L}\left[a_{2}\right]+M_{\text {ann }}^{L L}\left[C_{2}\right]\right\}+\left[\rho^{0} \leftrightarrow \eta_{n}\right] \tag{C22}
\end{align*}
$$

and

$$
\begin{align*}
\sqrt{2} A\left(\bar{B}_{s}^{0} \rightarrow \rho^{0} \eta_{s}\right)= & \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u s}^{*}\left\{f_{\rho} F_{B_{s} \rightarrow \eta_{s}}^{L L}\left[a_{2}\right]+M_{B_{s} \rightarrow \eta_{s}}^{L L}\left[C_{2}\right]\right\}  \tag{C23}\\
& -\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*}\left\{f_{\rho} F_{B_{s} \rightarrow \eta_{s}}^{L L}\left[\frac{3}{2} a_{7}+\frac{3}{2} a_{9}\right]+M_{B_{s} \rightarrow \eta_{s}}^{L L}\left[\frac{3}{2} C_{10}\right]-M_{B_{s} \rightarrow \eta_{s}}^{S P}\left[\frac{3}{2} C_{8}\right]\right\} .
\end{align*}
$$

For decays $\bar{B}_{s} \rightarrow \eta^{(1)} \omega$, we have

$$
\begin{align*}
2 A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} \omega\right)= & \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u s}^{*}\left\{f_{B_{s}} F_{\text {ann }}^{L L}\left[a_{2}\right]+M_{a n n}^{L L}\left[C_{2}\right]\right\} \\
& -\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*}\left\{M_{a n n}^{L L}\left[2 C_{4}+\frac{1}{2} C_{10}\right]-M_{a n n}^{S P}\left[2 C_{6}+\frac{1}{2} C_{8}\right]\right. \\
& \left.+f_{B_{s}} F_{a n n}^{L L}\left[2 a_{3}-2 a_{5}-\frac{1}{2} a_{7}+\frac{1}{2} a_{9}\right]\right\}+\left[\eta_{n} \leftrightarrow \omega\right]  \tag{C24}\\
\sqrt{2} A\left(\bar{B}_{s}^{0} \rightarrow \omega \eta_{s}\right)= & \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u s}^{*}\left\{f_{\omega} F_{B_{s} \rightarrow \eta_{s}}^{L L}\left[a_{2}\right]+M_{B_{s} \rightarrow \eta_{s}}^{L L}\left[C_{2}\right]\right\} \\
& -\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*}\left\{f_{\omega} F_{B_{s} \rightarrow \eta_{s}}^{L L}\left[2 a_{3}+2 a_{5}+\frac{1}{2} a_{7}+\frac{1}{2} a_{9}\right]\right. \\
& \left.+M_{B_{s} \rightarrow \eta_{s}}^{L L}\left[2 C_{4}+\frac{1}{2} C_{10}\right]-M_{B_{s} \rightarrow \eta_{s}}^{S P}\left[2 C_{6}+\frac{1}{2} C_{8}\right]\right\} \tag{C25}
\end{align*}
$$

And the decay amplitudes for physical states are

$$
\begin{align*}
& A\left(\bar{B}_{s} \rightarrow \eta \omega\right)=A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} \omega\right) \cos \phi-A\left(\bar{B}_{s}^{0} \rightarrow \omega \eta_{s}\right) \sin \phi,  \tag{C26}\\
& A\left(\bar{B}_{s} \rightarrow \eta^{\prime} \omega\right)=A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} \omega\right) \sin \phi+A\left(\bar{B}_{s}^{0} \rightarrow \omega \eta_{s}\right) \cos \phi \tag{C27}
\end{align*}
$$

For decays $\bar{B}_{s} \rightarrow \eta \phi$, we have

$$
\begin{align*}
\sqrt{2} A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} \phi\right)= & \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u s}^{*}\left\{f_{n} F_{B_{s} \rightarrow \phi}^{L L}\left[a_{2}\right]+M_{B_{s} \rightarrow \phi}^{L L}\left[C_{2}\right]\right\} \\
& -\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*}\left\{f_{n} F_{B_{s} \rightarrow \phi}^{L L}\left[2 a_{3}-2 a_{5}-\frac{1}{2} a_{7}+\frac{1}{2} a_{9}\right]\right. \\
& \left.+M_{B_{s} \rightarrow \phi}^{L L}\left[2 C_{4}+\frac{1}{2} C_{10}\right]+M_{B_{s} \rightarrow \phi}^{S P}\left[2 C_{6}+\frac{1}{2} C_{8}\right]\right\},  \tag{C28}\\
A\left(\bar{B}_{s}^{0} \rightarrow \eta_{s} \phi\right)= & -\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*}\left\{f_{s} F_{B_{s} \rightarrow \phi}^{L L}\left[a_{3}+a_{4}-a_{5}+\frac{1}{2} a_{7}-\frac{1}{2} a_{9}-\frac{1}{2} a_{10}\right]\right. \\
& -f_{s} F_{B_{s} \rightarrow \phi}^{S P}\left[a_{6}-\frac{1}{2} a_{8}\right]+M_{B_{s} \rightarrow \phi}^{L L}\left[C_{3}+C_{4}-\frac{1}{2} C_{9}-\frac{1}{2} C_{10}\right] \\
& +M_{B_{s} \rightarrow \phi}^{S P}\left[C_{6}-\frac{1}{2} C_{8}\right]+f_{B_{s}} F_{a n n}^{L L}\left[a_{3}+a_{4}-a_{5}+\frac{1}{2} a_{7}-\frac{1}{2} a_{9}-\frac{1}{2} a_{10}\right] \\
& +M_{a n n}^{L L}\left[C_{3}+C_{4}-\frac{1}{2} C_{9}-\frac{1}{2} C_{10}\right]-f_{B_{s}} F_{a n n}^{S P}\left[a_{6}-\frac{1}{2} a_{8}\right] \\
& \left.-M_{a n n}^{L R}\left[C_{5}-\frac{1}{2} C_{7}\right]-M_{a n n}^{S P}\left[C_{6}-\frac{1}{2} C_{8}\right]\right\}+\left[\eta_{s} \leftrightarrow \phi\right] . \tag{C29}
\end{align*}
$$

And the decay amplitudes for physical states are

$$
\begin{align*}
A\left(\bar{B}_{s} \rightarrow \eta \phi\right) & =A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} \phi\right) \cos \phi-A\left(\bar{B}_{s}^{0} \rightarrow \eta_{s} \phi\right) \sin \phi,  \tag{C30}\\
A\left(\bar{B}_{s} \rightarrow \eta^{\prime} \phi\right) & =A\left(\bar{B}_{s}^{0} \rightarrow \eta_{n} \phi\right) \sin \phi+A\left(\bar{B}_{s}^{0} \rightarrow \eta_{s} \phi\right) \cos \phi \tag{C31}
\end{align*}
$$

## APPENDIX D: ANALYTIC FORMULAE FOR THE $B_{s} \rightarrow V V$ DECAY AMPLITUDES

There are three kinds of polarizations in the $B_{s}$ meson decays to two vector final states, namely: Longitudinal (L), parallel (N) and transverse (T). The decay amplitudes are classified accordingly, with $i=L, N, T$.

## 1. Tree dominant decays

$$
\begin{align*}
A^{i}\left(\bar{B}_{s}^{0} \rightarrow \rho^{-} K^{*+}\right)= & \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u d}^{*}\left\{f_{\rho} F_{B_{s} \rightarrow K^{*}}^{L L, i}\left[a_{1}\right]+M_{B_{s} \rightarrow K^{*}}^{L L, i}\left[C_{1}\right]\right\} \\
& -\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t d}^{*}\left\{f_{\rho} F_{B_{s} \rightarrow K^{*}}^{L L, i}\left[a_{4}+a_{10}\right]\right. \\
& +M_{B_{s} \rightarrow K^{*}}^{L L, i}\left[C_{3}+C_{9}\right]-M_{B_{s} \rightarrow K^{*}}^{L R, i}\left[C_{5}+C_{7}\right] \\
& +f_{B_{s}} F_{a n n}^{L L, i}\left[a_{4}-\frac{1}{2} a_{10}\right]-f_{B_{s}} F_{a n n}^{S P, i}\left[a_{6}-\frac{1}{2} a_{8}\right] \\
& \left.+M_{a n n}^{L L, i}\left[C_{3}-\frac{1}{2} C_{9}\right]-M_{a n n}^{L R, i}\left[C_{5}-\frac{1}{2} C_{7}\right]\right\}, \tag{D1}
\end{align*}
$$

$$
\begin{align*}
\sqrt{2} A^{i}\left(\bar{B}_{s}^{0} \rightarrow \rho^{0} K^{* 0}\right)= & \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u d}^{*}\left\{f_{\rho} F_{B_{s} \rightarrow K^{*}}^{L L, i}\left[a_{2}\right]+M_{B_{s} \rightarrow K^{*}}^{L L, i}\left[C_{2}\right]\right\} \\
& +\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t d}^{*}\left\{f_{\rho} F_{B_{s} \rightarrow K^{*}}^{L L, i}\left[-a_{4}+\frac{3}{2} a_{7}+\frac{3}{2} a_{9}+\frac{1}{2} a_{10}\right]-M_{B_{s} \rightarrow K^{*}}^{L R, i}\left[-C_{5}+\frac{1}{2} C_{7}\right]\right. \\
& +M_{B_{s} \rightarrow K^{*}}^{L L, i}\left[-C_{3}+\frac{1}{2} C_{9}+\frac{3}{2} C_{10}\right]-M_{B_{s} \rightarrow K^{*}}^{S P, i}\left[\frac{3}{2} C_{8}\right] \\
& +f_{B_{s}} F_{a n n}^{L L, i}\left[-a_{4}+\frac{1}{2} a_{10}\right]-f_{B_{s}} F_{a n n}^{S P, i}\left[-a_{6}+\frac{1}{2} a_{8}\right] \\
& \left.+M_{a n n}^{L L, i}\left[-C_{3}+\frac{1}{2} C_{9}\right]-M_{a n n}^{L R, i}\left[-C_{5}+\frac{1}{2} C_{7}\right]\right\}, \tag{D2}
\end{align*}
$$

$$
\begin{align*}
\sqrt{2} A^{i}\left(\bar{B}_{s}^{0} \rightarrow \omega K^{* 0}\right)= & \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u d}^{*}\left\{f_{\omega} F_{B_{s} \rightarrow K^{*}}^{L L L, i}\left[a_{2}\right]+M_{B_{s} \rightarrow K^{*}}^{L L, i}\left[C_{2}\right]\right\} \\
& -\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t d}^{*}\left\{f_{\omega} F_{B_{s} \rightarrow K^{*}}^{L L L, i}\left[2 a_{3}+a_{4}+2 a_{5}+\frac{1}{2} a_{7}+\frac{1}{2} a_{9}-\frac{1}{2} a_{10}\right]\right. \\
& +M_{B_{s} \rightarrow K^{*}}^{L L L, i}\left[C_{3}+2 C_{4}-\frac{1}{2} C_{9}+\frac{1}{2} C_{10}\right] \\
& -M_{B_{s} \rightarrow K^{*}}^{L R, i}\left[C_{5}-\frac{1}{2} C_{7}\right]-M_{B_{s} \rightarrow K^{*}}^{S P, i}\left[2 C_{6}+\frac{1}{2} C_{8}\right] \\
& +f_{B_{s}} F_{a n n}^{L L, i}\left[a_{4}-\frac{1}{2} a_{10}\right]-f_{B_{s}} F_{a n n}^{S P, i}\left[a_{6}-\frac{1}{2} a_{8}\right] \\
& \left.+M_{a n n}^{L L, i}\left[C_{3}-\frac{1}{2} C_{9}\right]-M_{a n n}^{L R, i}\left[C_{5}-\frac{1}{2} C_{7}\right]\right\} . \tag{D3}
\end{align*}
$$

## 2. Pure annihilation type decays

$$
\begin{align*}
& A^{i}\left(\bar{B}_{s}^{0} \rightarrow \rho^{+} \rho^{-}\right)= \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u s}^{*}\left\{f_{B_{s}} F_{a n n}^{L L, i}\left[a_{2}\right]+M_{a n n}^{L L, i}\left[C_{2}\right]\right\} \\
&-\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*}\left\{f_{B_{s}} F_{a n n}^{L L, i}\left[2 a_{3}+\frac{1}{2} a_{9}\right]+f_{B_{s}} F_{a n n}^{L R, i}\left[2 a_{5}+\frac{1}{2} a_{7}\right]\right. \\
&\left.+M_{a n n}^{L L, i}\left[2 C_{4}+\frac{1}{2} C_{10}\right]+M_{a n n}^{S P, i}\left[2 C_{6}+\frac{1}{2} C_{8}\right]\right\}  \tag{D4}\\
& \sqrt{2} A^{i}\left(\bar{B}_{s}^{0} \rightarrow \rho^{0} \rho^{0}\right)= \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u s}^{*}\left\{f_{B_{s}} F_{a n n}^{L L, i}\left[a_{2}\right]+M_{a n n}^{L L, i}\left[C_{2}\right]\right\} \\
&-\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*}\left\{f_{B_{s}} F_{a n n}^{L L, i}\left[2 a_{3}+\frac{1}{2} a_{9}\right]+f_{B_{s}} F_{a n n}^{L R, i}\left[2 a_{5}+\frac{1}{2} a_{7}\right]\right. \\
&\left.+M_{a n n}^{L L, i}\left[2 C_{4}+\frac{1}{2} C_{10}\right]+M_{a n n}^{S P, i}\left[2 C_{6}+\frac{1}{2} C_{8}\right]\right\}  \tag{D5}\\
& \sqrt{2} A^{i}\left(\bar{B}_{s}^{0} \rightarrow \omega \omega\right)= \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u s}^{*}\left\{f_{B_{s}} F_{a n n}^{L L, i}\left[a_{2}\right]+M_{a n n}^{L L, i}\left[C_{2}\right]\right\} \\
&-\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*}\left\{f_{B_{s}} F_{a n n}^{L L, i}\left[2 a_{3}+\frac{1}{2} a_{9}\right]+f_{B_{s}} F_{a n n}^{L R, i}\left[2 a_{5}+\frac{1}{2} a_{7}\right]\right. \\
&\left.+M_{a n n}^{L L, i}\left[2 C_{4}+\frac{1}{2} C_{10}\right]+M_{a n n}^{S P, i}\left[2 C_{6}+\frac{1}{2} C_{8}\right]\right\},  \tag{D6}\\
& 2 A^{i}\left(\bar{B}_{s}^{0} \rightarrow \rho^{0} \omega\right)=\frac{G_{F}}{\sqrt{2}} V_{u b} V_{u s}^{*}\left\{f_{B_{s}} F_{a n n}^{L L, i}\left[a_{2}\right]+M_{a n n}^{L L, i}\left[C_{2}\right]\right\}-\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*}\left\{f_{B_{s}} F_{a n n}^{L L, i}\left[\frac{3}{2} a_{9}\right]\right. \\
&\left.+f_{B_{s}} F_{a n n}^{L R, i}\left[\frac{3}{2} a_{7}\right]+M_{a n n}^{L L, i}\left[\frac{3}{2} C_{10}\right]+M_{a n n}^{S P, i}\left[\frac{3}{2} C_{8}\right]\right\}+\left[\rho^{0} \leftrightarrow \omega\right] \tag{D7}
\end{align*}
$$

## 3. QCD penguin dominant decays

$$
\begin{align*}
A^{i}\left(\bar{B}_{s}^{0} \rightarrow K^{*-} K^{*+}\right)= & \frac{G_{F}}{\sqrt{2}} V_{u b} V_{u s}^{*}\left\{f_{K^{*}} F_{B_{s} \rightarrow K^{*}}^{L L, i}\left[a_{1}\right]+M_{B_{s} \rightarrow K^{*}}^{L L, i}\left[C_{1}\right]+f_{B_{s}} F_{a n n}^{L L, i}\left[a_{2}\right]\right. \\
& \left.+M_{a n n}^{L L, i}\left[C_{2}\right]\right\}-\frac{G_{F}}{\sqrt{2}} V_{t b} V_{t s}^{*}\left\{f_{K^{*}} F_{B_{s} \rightarrow K^{*}}^{L L, i}\left[a_{4}+a_{10}\right]\right. \\
& +M_{B_{s} \rightarrow K^{*}}^{L L, i}\left[C_{3}+C_{9}\right]-M_{B_{s} \rightarrow K}^{L R, i}\left[C_{5}+C_{7}\right] \\
